1.1.2 Introduction

HITACHI proudly presents the FSXNSE and FSXNPE models in the SET FREE series, characterised by its modular design. Space, structure and necessary functions, in line with evolution in building design, the requirements for air conditioning have also diversified.

Because the most suitable unit can be selected from a wide range of models for the standard type FSXNSE and the high efficiency type FSXNPE, you can create a custom air conditioning environment to satisfy your specific building conditions.

- Standard type: Nominal capacity from 22.4 kW to 268 kW (cooling mode) and from 25 kW to 305 kW (heating mode). Connectable indoor unit up to 64 depending on the model and total combination power from 50% up to 130%.
- High efficiency type: Nominal capacity from 14 kW to 201 kW (cooling mode) and from 16 kW to 225 kW (heating mode). Connectable indoor unit up to 64 depending on the model and total combination power from 50% up to 130% or 150%, depending on the model.

Standard and High efficiency type are available for heat pump system (2 pipes) and heat recovery system (3 pipes).

The FSXNSE range consists of 9 modules with different horsepower for each of the heat pump and heat recovery variants, while the FSXNPE range consists of 8 modules for each of the variants.

1.2 Safety

1.2.1 Applied symbols

During normal air to water heat pump system design work or unit installation, greater attention must be paid in certain situations requiring particular care in order to avoid damage to the unit, the installation or the building or property.

Situations that pose a risk to the safety of those in the surrounding area or to the unit itself are clearly indicated in this manual.

A series of special symbols are used to clearly identify these situations.

Pay close attention to these symbols and to the messages following them, as your safety and that of others depends on it.

DANGER

- ***The text following this symbol contains information and instructions relating directly to your safety.***
- ***Not taking these instructions into account could lead to serious, very serious or even fatal injuries to you and others.***

In the texts following the danger symbol you can also find information on safe procedures during unit installation.

CAUTION

- *The text following this symbol contains information and instructions relating directly to your safety and physical wellbeing.*
- *Not taking these instructions into account could lead to minor injuries to you and others in the proximities of the unit.*
- *Not taking these instructions into account could lead to unit damage.*

In the texts following the caution symbol you can also find information on safe procedures during unit installation.

NOTE

- *The text following this symbol contains information or instructions that may be of use or that require a more thorough explanation.*
- *Instructions regarding inspections to be made on unit parts or systems may also be included.*

1.2.2 Norms and Regulations

Following Regulation EU No. 517/2014 on Certain Fluorinated Greenhouse gases, it is mandatory to fill in the label attached to the unit with the total amount of refrigerant charged on the installation.

Do not vent R410A into the atmosphere: R410A are fluorinated greenhouse gases covered by the Kyoto protocol global warming potential (GWP) R410A: = 2088.

Tn of CO_2 equivalent of fluorinated greenhouse gases contained is calculated by indicated GWP multiply by Total Charge (in kg) indicated in the product label and divided by 1000.

Appropriate refrigerant

The refrigerant used in each unit is identified on the specification label and manuals of the unit. HITACHI shall not be held liable for any failure, trouble, malfunction or accident caused by units illegally charged with refrigerants other than the specified one.

Consequences of charging non-specified refrigerant

It may cause mechanical failure, malfunction and other accidents. It may cause operational failure of protection and safety devices of air conditioners. It may also cause lubrication failure of the sliding part of the compressor due to deterioration of refrigerant oil.

In particular, hydrocarbon refrigerants (such as propane, R441A, R443A, GF-08, etc.) are not allowed, since these are combustible and may cause major accidents such as fire and explosion in case of improper handling.

Once a non-specified refrigerant has been charged, no further servicing (including draining of refrigerant) shall be performed, even in case of malfunction. Improper handling of refrigerant may be a cause of fire and explosion, and servicing in such cases may be considered an illegal act.

End clients and costumers shall be informed that servicing is not approved, and the installer who charged the non-specified refrigerant shall be asked to fix the unit.

HITACHI will accept no responsibility for units that have been charged with non-specified refrigerant once.

2.1 Benefits of the choice

2.1.1 New SET FREE FSXNSE / FSXNPE series

HITACHI introduces the New SET FREE FSXNSE / FSXNPE series, the highly-efficient and reliable air-conditioning system.

Nowadays, increased numbers of buildings are required to have "intelligent" facilities, able to manage complex communication and office automation networks, while ensuring a comfortable environment for their occupants at the same time.

This requirement to provide a comfortable environment is made further complicated by the need of fulfilment under external ambient conditions which are subject to a great variation around the year.

The ever-changing needs in space, structure and functionality, together with the evolution in building design and construction technique trends, have also brought a diversification in air conditioning systems.

The HITACHI multi-split air conditioning systems of the SET FREE series have been conceived to satisfy these needs and requirements. The proven combination of the scroll compressor and the inverter provides the most suitable solution for the air conditioning of small and medium office buildings.

The new Standard FSXNSE SET FREE series consists of 9 types of modular outdoor unit, while the new High Efficiency FSXNPE Set Free series offers an additional 8 types of modular outdoor unit.

Outdoor units belonging to the same series can also be combined, resulting in an even larger number of variations ready to meet the specific air conditioning needs of a particular building.

The wide range of modules, with capacities of up to 24 HP in a single base unit (Standard series), 18 HP High Efficiency series, makes it possible to cover the needs of most installations with a smaller number of modules, which results in significant space saving and simplification of installation works.

Furthermore, the possibility of managing the units through any of the remote control systems available means that overall system performance can be optimised, adjusting power consumption to the demand requirements of each situation.

It is also possible to extend existing installations with the addition of new indoor units up to a total capacity of 130% (Standard series) and 130% or 150% (depending on the model of High Efficiency series) of the capacity provided by the outdoor unit; on the other hand, in case that it was necessary to reduce the number of indoor units for any reason, the system can keep operation with an installed indoor unit capacity as low as 50% of the outdoor unit capacity.

2.1.2 Choice range

By combining a maximum of 4 base outdoor units, the SET FREE RAS-FSXN(S/P)E outdoor units series allows to build up the total capacity up to 96 HP (standard series) and 72 HP (High efficiency series).

This system can provide separate refrigeration and heating (two-pipe heat pump system) or simultaneous refrigeration and heating (three-pipe heat recovery system)

◆ **The new extended line-up:**

- High efficiency series line-up:
  - From maximum 36HP to maximum 54HP in heat recovery models and to 72HP in Heat Pump system
- Expand Standard series line-up:
  - From maximun 54HP to maximun 96 HP in a heat pump models
- Expand single module range:
  - Both for standard and high efficiency

2.1.4 New CH-Box - models for single and multiple connection

New CH-Box series with models for a single connection or multiple connection are compatible with the new SET FREE FSXN(S/P)E series in a Heat Recovery system (3 pipes):

Series	Single		Multiple			
	<6HP	6.1HP - 10HP	4 Branch	8 Branch	12 Branch	16 Branch
Current Model (CH Unit)	●	●	-	-	-	-
New Model (CH-Box)	★	★	★	★	★	★

● Current model ★ New model - Not available

The HITACHI CH-Box do not need a drain piping because inside is filled with Urethane, which means a reduction of installation cost.

HITACHI offers the CH-Box units as an optional elements for the heat recovery system (3 pipes). In these systems, the CH-Box allow the indoor units connected to them to function in cooling or heating mode, independently of the operation mode of other indoor units connected to other CH-Box.

The installation of these units facilitates the creation of sectors within the air conditioning system. These sectors function in cooling or heating mode independently, therefore reducing the quantity of pipes necessary and the complexity of the installation.

The electrical box of the CH-Box single has a flexible anchoring system. This means the box can be installed on either side to adapt to the available installation space.

NOTE

- *The functioning of the CH-Box occasionally produces a small quantity of noise, above all during the start-up or stoppage of the indoor unit or when the defrost mode in the outdoor unit is activated with very low outdoor temperatures.*
- *The CH-Box can be installed, for example, in false ceilings or places other than where the indoor unit is installed. The unit is supplied in kit form, with the necessary connections for the refrigerant pipes.*

2.1.5 Range of accessories and remote control range

◆ Range of accessories

All the outdoor units have a range of accessories that facilitate installation, operation and maintenance.

These accessories are designed to adapt the unit to the type of installation that the air conditioning system requires and improve its performance, always bearing in mind the quality parameters required.

The range of accessories includes:

- Control devices, for handling and managing the operation of the installation.
- Pipe Connection Kit, for pipe branches connection of outdoor units.
- Multi-kits and distributors for pipe branches connection of indoor units.
- Drainage pipes, to collect the condensation and then channel it.
- CH-Box (only for heat recovery systems).

◆ Range of remote control

Unit management through the range of remote controls

In addition to the common functions available in the remote controls, the SET FREE FSXN(S/P)E series range of outdoor units from HITACHI incorporates simultaneous management functions for groups of units.

- It is possible to use two remote controls for two indoor units, or use a single control by organising the indoor units in control groups (for example, from 1 to 16 units in each group).
- The safety functions included keep the timer functioning even if there are problems with the power supply (even during power cuts lasting several weeks).
- Optional “Night mode” function, which modifies the management of the outdoor unit fans and reduces sound emissions during the night in urban or especially sensitive environments such as hospitals.
- Additional optional functions for groups of units, such as simultaneous fan rotation.

The management functions also include the solution of any incident that may occur.

- Automatic checking for the solution of incidents, which are reported in real time by an alarm code.
- Incident codes, which are shown on the control display should any operation anomaly occur (in addition, detailed information on these is shown)

HITACHI offers a range of remote control systems that are classified according to the type of management and the number of units they manage:

- Individual remote control systems.
- Centralized remote control systems.
- Building air conditioning systems (CS-NET WEB).
- BMS (Building Management Systems).

◆ Individual remote control systems

The individual remote control systems, whether they are wireless or connected directly by cable, have a wide range of functions for easier unit management, the programming of specific settings or the identification of incidents. Recommended for managing a small number of units.

◆ Centralized remote control systems

The centralized remote control systems combine the functions of the remote controls and extend the management and setting possibilities for several air conditioning systems distributed around the entire floor of a building.

◆ Computerized control systems

Computerized control systems increase management and setting possibilities and allow this to be carried out from any point of the local communication network, by means of a two-core non-polarity cable or even using the Internet.

Recommended when you wish to independently manage more than two plants in one building.

◆ BMS (Building Management System)

Integration into installations with intelligent management. Gateway interface with Lonworks, KNX, MODBUS and BACnet BMS systems.

TCGB0119_rev2.indb 26 28/02/2018 16:35:19

2.1.6 Flexible system

◆ SYSTEM FREE: combination of different indoor units

The indoor units of the SET FREE series can be combined as required in any HITACHI system to create the most suitable air conditioning system for each environment.

The variety of capacities and installation accessories greatly facilitate the installation design. Furthermore, unit management through any of the remote control systems available means that the total performance of the system is optimised.

2.3 Installation flexibility for expand external static pressure

For installation spaces such as a balcony or a floor where an external static pressure such as a louver or a duct is required to secure, the 3 steps external static pressure (80Pa, 60Pa and 30Pa) by the dip switch setting (DSW8) is newly adopted (current model is 60Pa only).

◆ Installation example for air outlet duct (field supplied)

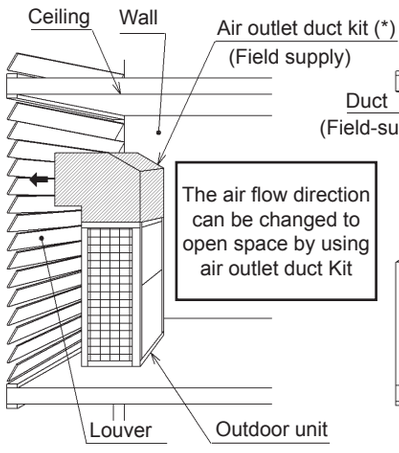
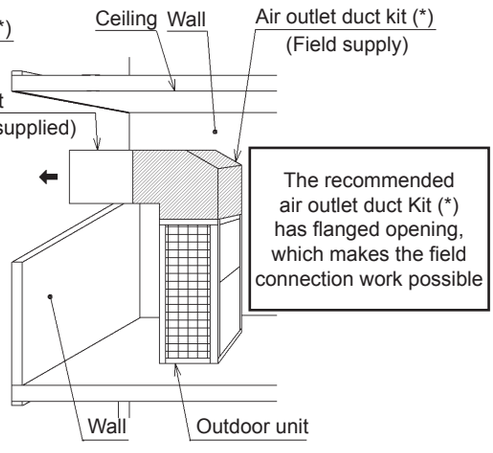
	#1	#2
30Pa	ON	OFF
60Pa	OFF	ON
80Pa	ON	ON

Case that open space is louver



Case that open space is wall



NOTES

- *Pay attention to the following case at the design and the installation. If the outlet air intakes by short-circuit, the operation range is limited due to increasing high pressure in the cooling operation or decreasing low pressure in the heating operation so that may cause failure of unit.*
- *(*) Air outlet duct is field supply.*

◆ Improvement of Piping Installation

Piping work condition height difference between outdoor unit and indoor unit (Outdoor unit is higher) has been increased comparison with the current series

New series	Current series
≤50m (Standard) ≤110m (*)	≤50m (Standard) ≤90m (Sales Order)

(*) Longer piping (up to 110m) is available for all models. Note that the approval from HITACHI Customer Service Department must be obtained beforehand in case that height difference is over 50m. Contact the HITACHI Customer Service Department in order to provide the relevant system characteristics for feasibility evaluation.

◆ Improvement of combination ratio

Combination ratio of the indoor units has been increased in order to achieve the requirements of the new buildings, allowing a cost reductions of the installations or extend existing installations with the addition of new indoor units.

Standard series - RAS-FSXNSE	Current RAS-FSXN1E
50 to 130% (*1) (In case the combination ratio exceed 130%) (*2)	50 to 130%

High Efficiency series - RAS-FSXNPE	Current RAS-FSXNHE
50 to 150% (5 to 54HP) (*1) 50 to 130% (56 to 72HP) (*1) (In case the combination ratio exceed 130% or 150%) (*2)	50 to 130%

NOTE

*(*1) Simultaneous operation of indoor units in the same operation mode is only possible up to a capacity ratio of 100%. If this combination ratio is exceeded, up to the respective maximum of 130% or 150% depending on the model, capacity loss may occur.*

*(*2) Note that the approval from HITACHI Customer Service Department must be obtained beforehand in case that the capacity combination ratio of the corresponding outdoor unit is exceeded. Contact the HITACHI Customer Service Department to provide the relevant system characteristics for evaluation of feasibility. It is not permitted to exceed the maximum combination ratio of the corresponding outdoor unit without prior consultation and approval from the distributor or dealer, as this may cause the activation of alarms and operational failure.*

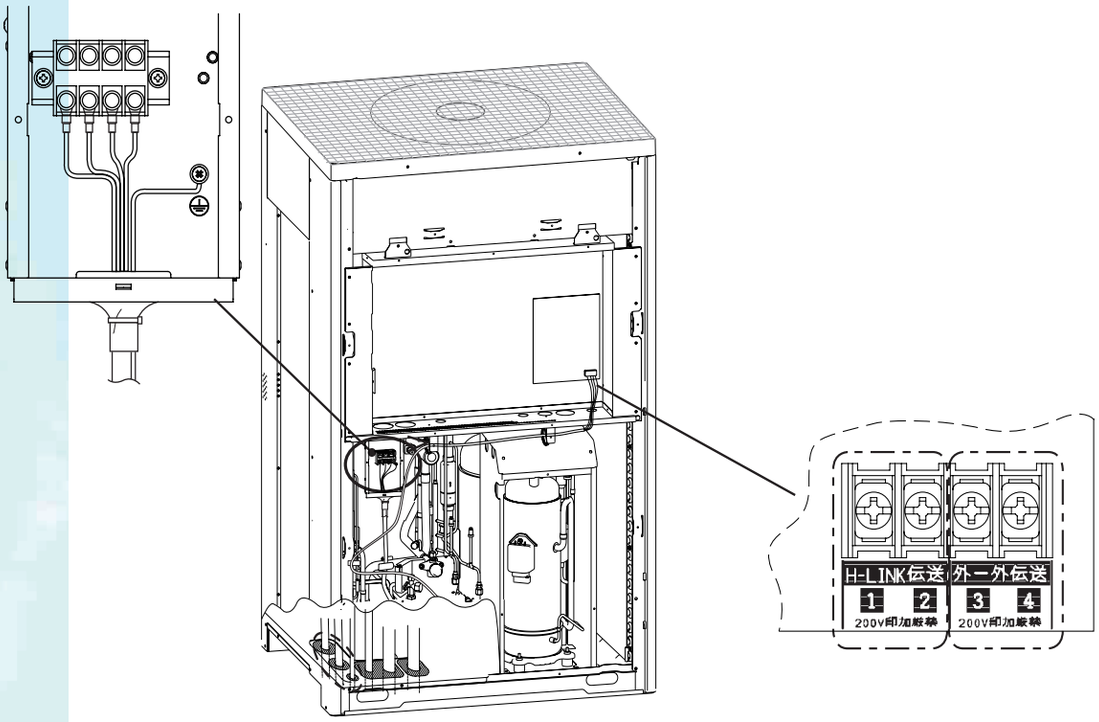
In the following cases, 150% capacity ratio is not available. Set the connection ratio to be below 130%:

- *Operate all the indoor units simultaneously.*
- *All the connected indoor units are 4-way cassette (RCI-FSN3) 1HP.*
- *Total capacity of connected 4-way cassette indoor units (RCI-FSN3) exceed 80% of all the connected indoor units.*
- *Small capacity indoor units (below 0.6HP) is included to the combination of the indoor units.*

TCGB0119_rev2.indb 32 28/02/2018 16:35:22

2.3.1 Other features of the installation

- The FSXNSE - Standard and FSXNPE - High Efficiency outdoor units have a drain hose as an optional accessory, with the function of converting the base of the unit into a condensation collection and drain pan. This accessory is especially helpful in climates with a high humidity as, on one hand, it prevents the accumulation of water around the unit and the possible leaks that may form in the building's roof and, on the other, it facilitates the channelling of the condensation towards one of the building's drains with an additional field-supplied pipe.
- The electrical connection of the unit is done centrally, in other words, all the connection requirements, for both power supply and communication, are made at one single point. Both the power supply and communication cables enter the unit through their respective protection conducts, meet in the electrical box and are connected directly to the terminal boards (TB1, TB2).
- Communication between units is by a two-core communication cable without poles. Thus communication faults due to connection errors during installation are avoided. In addition, the communication terminals are smaller.



⚠ CAUTION

The resistance of the suspended floors or ceilings must be sufficient to support the weight of the unit, and must take into account the safety margins determined by the competent authorities in each country.

TCGB0119_rev2.indb 33 28/02/2018 16:35:23

- The combination of 2 or up to 4 basic outdoor units, of different power ranges to obtain greater power ranges, requires one of them to be the master or main unit. The rest of the units in the combination, called secondary units, act in coordination with the main unit. This feature is especially helpful for optimizing the functioning of all of them, both as a whole and individually. For example, if there is a power failure in any of the units, the rest will assume its functions and regulate the supply capacity to minimize the drop in operational power.

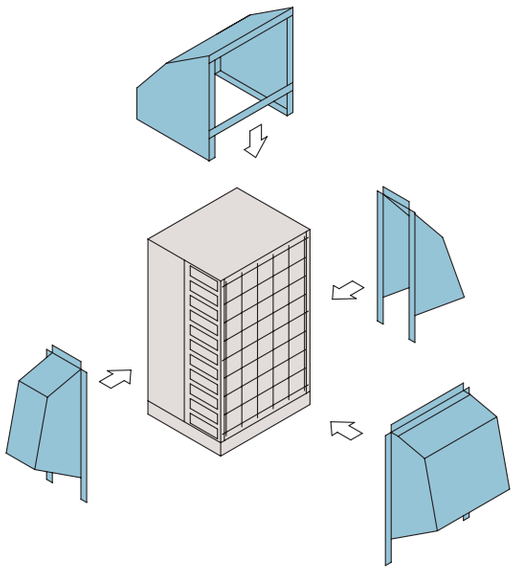
D	Secondary outdoor unit
E	H-LINK II transmission cable
F	Transmission cable from main unit to secondary unit
G	CH-Box 1
H	CH-Box 2
I	Indoor unit
J	Transmission cable from CH unit to indoor unit

- For units installed in areas with an adverse climate, especially with strong seasonal winds and/or snowfall, the outdoor units need guards as optional field-supplied accessories. These guards are especially useful for preventing drops in unit performance or complete stoppage due to blockages in the air inlets or outlets.



NOTE

- *To install outdoor units in areas with heavy snowfall, they must have suitable foundations so that they remain at least 50 cm above the maximum levels of accumulated snow.*

◆ Easy and flexible pipe installation

Installation work optimization

The HITACHI installation system is one of the easiest and most flexible on the market. It also offers substantial cost savings right from its installation, and start-up, during its whole useful life and even during maintenance work.

The different members of the SET FREE family of outdoor units have common installation elements, which makes installation work simpler with less requirements in terms of materials.

Reduction and standardising of installation pipe diameters

The diameters of the necessary connection pipes have been standardised wherever possible during the design process for the SET FREE units. Therefore, the majority of the outdoor units use connection tubes of a similar diameter throughout the facility, which simplifies installation work.

It is possible to configure the whole installation of an air conditioning system using a small number of different pipe diameters.

Longer pipes between outdoor and indoor units

The distance between units is no longer a conditioning factor and has become a factor that favours freedom of design in air conditioning installations. The design and the power of the outdoor units mean that indoor units can be installed further away.

The possibility of installing outdoor units further away offers greater decision-making autonomy and means that the most favourable location can be chosen. The distance between outdoor and indoor units can be up to 165 m.

NOTE

When the total length of the refrigerant pipes exceeds 300 m, the maximum additional refrigerant charge is restricted. Consult the conditions in chapter "10.8.5 Maximum additional refrigerant charge".

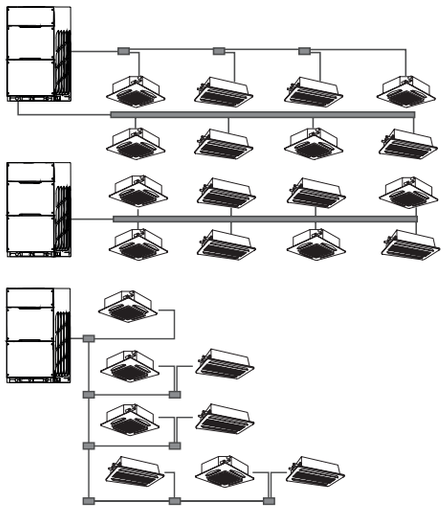
Multi-kits and distributors

The HITACHI SET FREE FSXN(S/P)E outdoor units offer a high level of flexibility of installation both for the outdoor and indoor units, and their interconnections. These interconnections accept different types of systems, up to a maximum of 64 indoor units.

NOTE

For extensive details on the connection possibilities and the capacities of the outdoor units, consult chapter "4.1 Procedure for selection of the system".

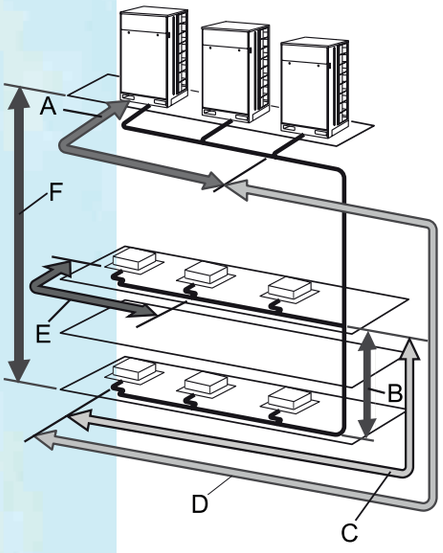
The following figures show some examples of the various configuration possibilities for the interconnections between the outdoor and indoor units.



Flexibility to expand the installation

The maximum total length of the refrigerant pipes is 1000 m (300 m)[1), 2)] and the maximum length of the pipe between the first branch of the multi-kit and the last indoor unit connected is 90 m (40 m)[2)].

TCGB0119_rev2.indb 35 28/02/2018 16:35:23



A. Outdoor units. Maximum pipe length: 10 m. Difference in height: 0.1 m.

B. Difference in height of the indoor units: 30 m.

C. Maximum pipe length between the first branch of the multi-kit and the last indoor unit connected: 90 m (40 m)[2)].

D. Length of pipe between outdoor and indoor units. Maximum pipe length: 165 m. Maximum total pipe length: 1000 m (300 m)[1), 2)].

E. Maximum pipe length between the branch and the indoor unit: 40 m (30 m)[2)].

F. Difference in height between the outdoor unit and the indoor units: 50 m [3)] (outdoor unit higher than the indoor units); 40m (outdoor unit lower than the indoor units).

[1)] When the total length of the refrigerant pipes exceeds 300 m, the maximum additional refrigerant charge is restricted.

[2)] If the refrigerant pipe length exceeds the values indicated in brackets, the maximum number of indoor units that can be connected must be less than the recommended.

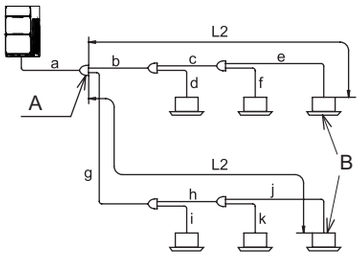
[3)] Longer piping (up to 110m) is available for all models. Note that the approval from HITACHI Customer Service Department must be obtained beforehand in case that height difference is over 50m. Contact the HITACHI Customer Service Department in order to provide the relevant system characteristics for feasibility evaluation.

◆ Flexibility to expand the installation

The flexible design for the air conditioning installations is one of the most important factors for the SET FREE FSXNSE and FSXNPE system.

Unlimited number of Main Piping Branches as long as the following restrictions are respected.

In the case that the piping length L2 from the multi-kit at the first branch to the farthest indoor unit is over 40m, follow the instructions below when performing the field-supplied piping work.



Piping length from multi-kit at the first branch to the terminal indoor unit is within 40 and 90 m.

A	Main branch
B	Terminal indoor unit

Heat pump system (Installation with main piping branch)

1 In the case that L2 is over 40m, the size of gas and liquid lines “b and c” or “g and h” should be increased by one size with reducers (field-supplied).
   - If (a) is smaller than (b, c) after increasing the size, increase the size of (a) to the same size as (b, c)

2 The difference between the piping length from the first branch to the farthest indoor unit and the piping length from the first branch to the closest indoor unit must be less than 40m.
   - (g+h+j)-(b+d) < 40m

Heat recovery system (Installation with main piping branch)

1 The difference between the piping length from the first branch to the farthest indoor unit and the piping length from the first branch to the closest indoor unit must be less than 40m.
   - (g+h+j)-(b+d) < 40m

NOTE

- *Do not size up the piping for heat recovery system. Otherwise, it may cause failure.*
- *For heat recovery system, there is no restriction if installed without a main piping branch.*
- *Main Piping Branch: Both of the pipes branched from multi-kit are connected to a further multi-kit.*

◆ High number of connectable indoor units

To adapt as far as possible to all the connection needs and possibilities, up to 64 indoor units can be connected to one single SET FREE FSXNSE / FSXNPE outdoor unit.

In comparison with previous models, this feature represents a big advantage, as it is possible to manage the greatest number of indoor units with fewer outdoor units, which entails significant savings in energy and installations.

- C: If the communication circuit fuse is melted, the PCB1 board can only be recovered by activating PIN 2.

Complete communication

The indoor units maintain active communications with each other, with the outdoor units and with the control systems over a communication called H-LINK II. This way the performance of each unit, among other aspects, is adapted to the circumstances at all times and remains the most appropriate in each situation.

TCGB0119_rev2.indb 38 28/02/2018 16:35:25

Easy connection

The communications H-LINK II is formed by a pair of small-diameter cores with no specific polarity. Given that no multi-way communication cables are used, the installation is simple, fast and effective. It is not possible to mistake the connections.

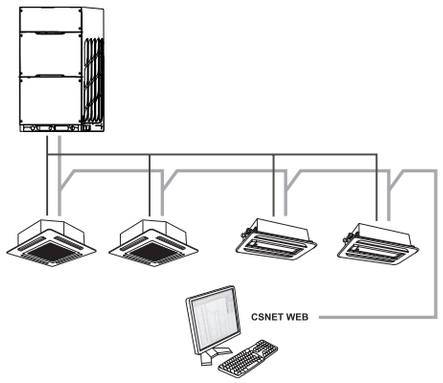
The two-core non-polarity communication H-LINK II implies considerable savings in terms of materials and installation, as the same cable is used for all the units and connected to them directly, quickly and easily.

Up to 160 units connected in a single H-LINK II bus line

It is possible to connect up to 160 indoor units from the SYSTEM FREE range in a single H-LINK II bus line. To expand the installation or increase the bus lines available, simply add a new line.

All of the units are managed as one through the control systems installed.

Example of H-LINK II system:



Specifications	
Transmission cable:	2-core
Transmission cable polarity:	No polarity
Maximum number of outdoor units connected:	64 units per H-LINK II system
Maximum number of indoor units connected:	160 units per H-LINK II system
Maximum number of units:	200
Maximum wiring length:	Total 1,000 m (including CSNET-WEB)
Recommended cable:	Shielded twisted pair cable or shielded pair cable over 0.75 mm^2 (equivalent to KPEV-S)
Voltage:	5 V DC

NOTE

- *The DSW must be adjusted when the H-LINK II bus is used. If they are set incorrectly, a transmission error may occur.*
- *The H-LINK II system offers a high level of flexibility for the design of air conditioning systems, due to its simple installation and the low total cost. Furthermore, centralized management is possible by connecting the CSNET-WEB control system to the H-LINK II network cables.*
- *Additionally, using CSNET-WEB, it is possible to manage the installation over the internet.*

Fast connection of new units

Extending the air conditioning system is now even easier. To add new units to the communication bus, it is only necessary to connect the two bus cables to the communication terminals.

The new units that are added to the bus line are recognised by the control system and are configured automatically.

Auto-configuration of system units

The control systems for the air conditioning system are auto-configurable. In other words, they recognise the type of unit to which they are connected, and the type of indoor unit and its capacity. The installation is started up more quickly and efficiently.

You can also configure all the units manually, so as to adjust the installation following customised parameters.

TCGB0119_rev2.indb 39 28/02/2018 16:35:25

2.4 Start-up benefits

2.4.1 Automatic start-up

The installation is started up automatically, therefore considerably reducing the time required for the process.

There are three types of start-up:

- Test run and identification of the units forming the system.
- Test run from the remote control.
- Test run from the outdoor unit.

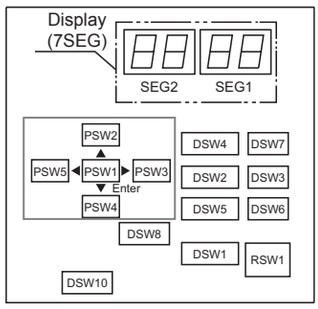
◆ Test run and identification of the system units

The test run can be carried out from either the rotating DSW on the outdoor unit or from the remote control for the indoor unit.

The 7-segment display on the outdoor unit provides all of the information required to check the system is operating properly.

The units forming part of the system are identified separately for the outdoor and indoor units:

- Outdoor units: using the remote control, the series to which each of the operational outdoor units belongs (for example, simple or multiple series) can be assigned.
- Indoor units: using the rotary and DSW on each unit.



◆ Test run from the remote control

Three operations for the test run are possible from the remote control:

1 Auto-diagnostic: quick check of the operating conditions of the indoor units and outdoor unit.

2 Data memory query: in the event of an alarm, the remote control saves all the operating parameters of the unit at that particular time and the screen displays the corresponding fault code. The air conditioning system diagnostic is simple and effective.

3 Optional function setting: the remote control is able to make settings on up to 29 possible options, such as the four-degree offset in heating mode or the increase in fan speed. It is possible to set several indoor units at the same time and to modify the unit configuration once installation is complete.

◆ Test run from the outdoor unit

The 7-segment display of the outdoor unit shows parameters related to the functioning of the unit.

Any incident occurring during start-up or normal operation is diagnosed through the display.

TCGB0119_rev2.indb 40 28/02/2018 16:35:25

2.4.2 Service verification

◆ System operation control

The working order of the system is continuously monitored through the control system. All operating parameters that the system uses to manage the outdoor and indoor units are continuously supervised.

◆ Assisted-management air conditioning system

The air conditioning system can be managed conveniently using the assisted management software HITACHI Service Tools.

This software enables, for example, a laptop computer to be connected to the air conditioning system by means of an interface connected to the H-LINK II bus. Using different menus, the software allows you to manage all the systems connected effectively and obtain data to optimise system performance.

◆ Compilation of operating data

All the data obtained using HITACHI Service Tools is compiled in different formats and monitored in various ways. The user of the software can configure the data handling to monitor those parameters that are the most important in each installation.

The data reports allow you to verify the system operation continuously. Any deviation in the stipulated ranges of values are detected immediately.

The combination ratio has increased up to 130% or 150% depending on the model in the High Efficiency series FSXNPE, covering the installation needs with a less outdoor units power, which means in practice into a lower cost of installation.

NOTE

Indoor unit simultaneous operation capacity should be less than outdoor unit capacity. Otherwise, it may cause a decrease of operating performance and operating limit in overload operation.

2.5.3 Combination with new 0.4HP indoor unit (RCIM/RPI/RPK)

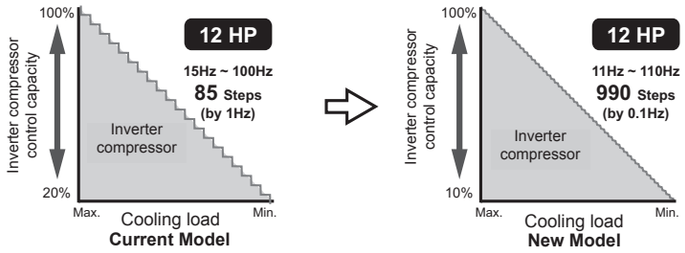
2.5.7 Operation Control

◆ Smooth Drive Control System

Capacity Control by 0.1Hz

The highly improved performance as well as greater energy saving is achieved by adopting newly developed high efficiency DC inverter compressor, with outstandingly precise control technology of 0.1Hz increments inverter frequency. Another feature is the dramatically extended working range, enabled by expanding the compressor's operating frequency band, both upwards and downwards.



Calculate the amount of refrigerant to charge based on the load information from the indoor units. Control inverter compressor rotation speed and charge proper amount of refrigerant to indoor unit at each loading condition. Suppress compressor switching ON/OFF at low load operation for better energy efficiency with smooth operation.

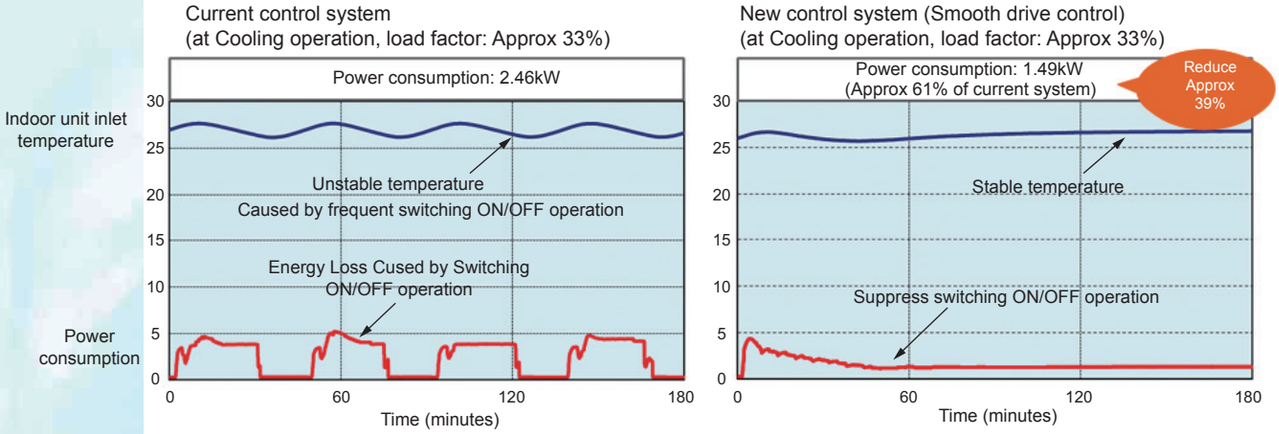
◆ Verification Result of Energy Saving Effect from Smooth Drive Control

More energy saving allowed by removing compressor switching ON/OFF at low load operation.

The verification result of energy saving effect at part load testing chamber is shown below. The "Smooth Drive Control System" suppress the compressor switching ON/OFF operation and keep room temperature stable. The reduction of power consumption has been verified



The verification test has been implemented with the combination of VRF outdoor unit and two 4-way cassette indoor units (RCI).

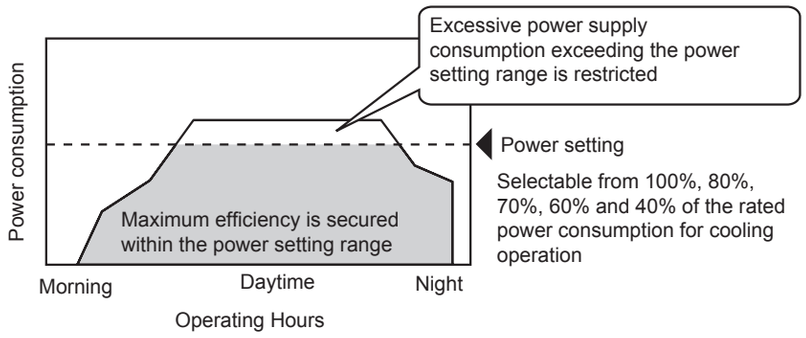
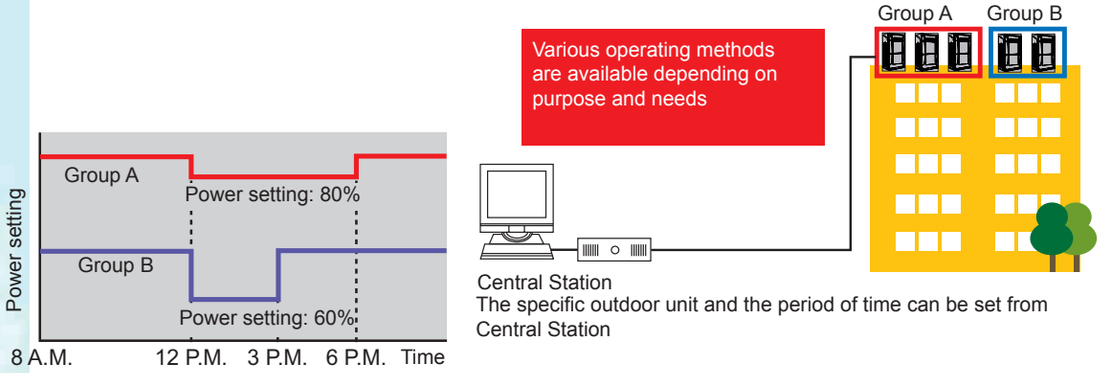
2.5.8 Improvement of Energy-Saving by Central Station

"Self-Demand Function(*)" can be set per outdoor unit from Central Station.

For small and medium buildings, it facilitates the power saving. The energy-saving operation can be adjusted according to an operating environment and individual needs.



Setting Example: Schedule Setting for Each Group by Central Station DX



NOTES

- *(*) Self-Demand Function: It saves the capacity in order not to exceed the demand current control according to the electric power information which the air conditioner detects. The current can exceed the limits depending on the system conditions (for example in defrost mode).*
- *The demand current control (%) is indicated by approximate values. The value in this control which is calculated by the current is different precision from the value in the wattmeter.*
- *If it is required that the maximum power consumption is managed precisely, a field-supplied demand controller should be used.*
- *The range may temporarily be higher than the power setting range (%) depending on the operating control condition such as protection control.*
- *When the above self-demand control is set, the performance is restricted because the rotation frequency of compressor is forcibly decreased.*

It is possible to choose between three emissions level settings through the PCB of the outdoor unit.

Lower sound power/pressure level by three steps:

	Sound power level dB(A)

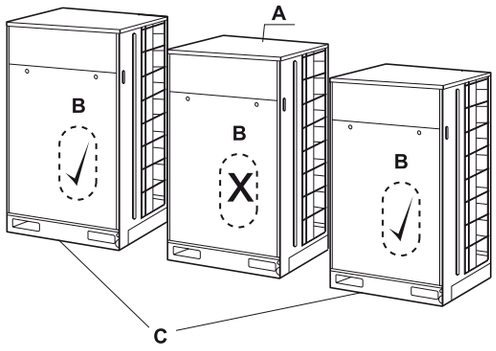
2.5.12 Backup operation function for emergency

The backup function prevents the system stopping completely when a failure occurs in any of the outdoor units of the same refrigerant cycle.



A	Outdoor unit failed
B	Compressor
C	Even if one unit fails, the others can function continuously

NOTE

- *So the backup function may be used, you need two or more outdoor units in the same refrigerant cycle.*
- *Maintaining the backup function for more than eight hours may damage the unit.*

If a fault occurs in the compressor of any of the outdoor units, it is possible to activate the emergency operation mode from the remote control, as follows (example with PC-ARFPE remote controller):

1	Press Menu for 3 seconds
2	In "emergency operation" is indicated on the screen and emergency operation begins

NOTE

In "emergency operation" is cancelled due to a reset of the outdoor unit (power source, etc).

The backup function may be activated when the following alarm codes are indicated on the remote control display:

Code	Category	Possible cause of the failure
06	Inverter compressor failure	Abnormal inverter voltage
23		Discharge gas thermistor at top of compressor
51		Abnormal inverter current sensor
53		Inverter error signal detection
54		Abnormal inverter fin temperature
23	Constant speed compressor failure	Discharge gas thermistor at top of compressor
39		Abnormal running current in constant speed compressor

2.5.13 Outdoor unit rotation function

The operation time regulation for each outdoor unit enables the load to be reduced in compressors(1), (2). Applying the same operating frequency to all the compressors in outdoor units in the same refrigerant cycle is the equivalent to equaling their loads, which improves the durability of the outdoor unit.

NOTE

- *(1) So the outdoor unit rotation function may be used, you need two or more outdoor units in the same refrigerant cycle.*
- *(2) Comparison between the application and non-application of the outdoor unit rotation function in the same system.*

2.5.14 Control over operating values (optional function)

The following settings improve the operating values for the installation by adapting it to different environments.

2.5.15 Decrease of forced air turbulence and vibrations

The aerodynamics of the blades has a deciding influence on the operation of the outdoor units. This matter has been studied in depth to avoid the air turbulence that reduces operation efficiency. The use of new materials for the manufacture of the blades decreases energy consumption, resulting in smoother changes in fan rotation speed. This improves comfort, as users do not perceive sudden changes in air flow and temperature.

The transmission of vibrations due to operation has been eliminated by using non-resonant suspension structures. The frame of the outdoor units is sized and insulated to avoid the generation and transmission of vibrations through the fixtures.

2.5.16 Lower energy consumption

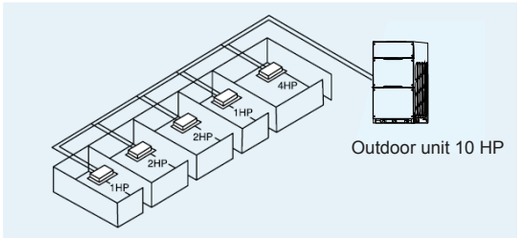
The new range of SET FREE FSXNPE indoor units benefits from in-depth functional and constructive studies of all their elements, aimed at optimizing their operation and reducing energy consumption. The harmonization of all the internal components enables more rational operating modes, in accordance with current environmental demands.

They achieve high yield and operation efficiency that result in a significant reduction in the yearly cost of the electricity bill.

2.5.17 Multiple capacity control

For the air conditioning system to operate more efficiently, the most suitable refrigerant flow rate is managed at all times according to the number of indoor units in operation.

Using the temperature difference between the inlet and outlet air from the indoor unit, the most suitable opening of the electronic expansion valve for the refrigerant supply is controlled. Thus all the units can function in different conditions.



2.5.18 Silent compressor

The outdoor SET FREE FSXNSE and FSXNPE units have been designed to reduce noise emissions as much as possible. The combined use of Scroll compressors and an insulation cover, reduces noise emissions to minimal levels.

The neodymium magnets on the compressor rotor (direct current) improve its features at low frequencies. Separating the compressor rotor into two parts reduces electromagnetic interference significantly.

Silent fan

Low operating noise with new designs and materials

The shape of the blades has been developed to minimize the turbulence in the air propelled by the fan. The laminated surface of the blades prevents air turbulence forming. Similarly, the use of mica and polypropylene in the manufacture of the fan minimizes the characteristic vibrations and, consequently, the noise emissions. This combination of materials and design decreases noise emissions in comparison with previous models.

Quiet operation with a silent motor

To prevent the emission of electromagnetic noise, research was carried out into the materials used in the manufacture of the elements of the motor.

As result, for the manufacture of the motor, cast aluminium and an operation control system with low noise emission, without losing operating characteristics have been selected. Furthermore, a non-resonant suspension system has been incorporated into the fan motor. Vibrations are minimized thanks to this structure.

TCGB0119_rev2.indb 50 28/02/2018 16:35:37

Low noise levels during nightly operation

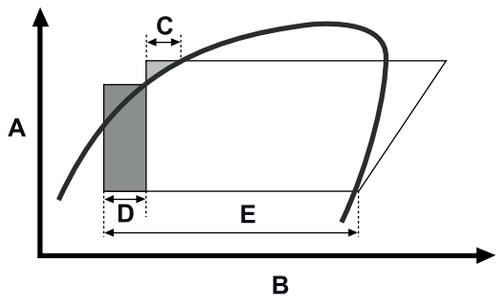
Using computerized simulation of fluid turbulence, the main source of unwanted noise, and by observing visually this flow, it has been possible to analyze completely the operation sound.

By improving the structure of the cabinet and the shape of the fan, and by adopting an inverter and new materials, it has been possible to reduce operating noise. The result has been a quiet operation design that respects the people around it and the environment.

2.5.19 Highly efficient refrigerant cycle

The features on the outdoor unit have improved considerably by applying a super-cooling circuit for the refrigerant cycle and by optimizing the piping system.

A	Pressure.
B	Capacity.
C	Sub-cooling effect.
D	Refrigeration capacity increased due to the super-cooling circuit.
E	Cooling capacity.

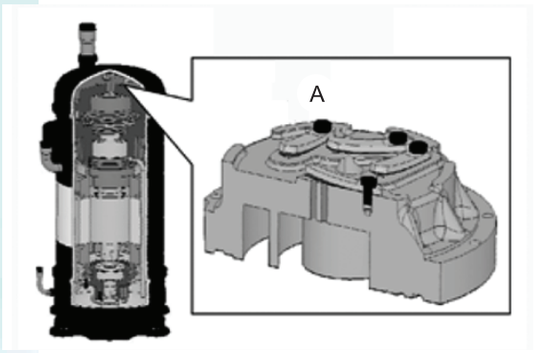


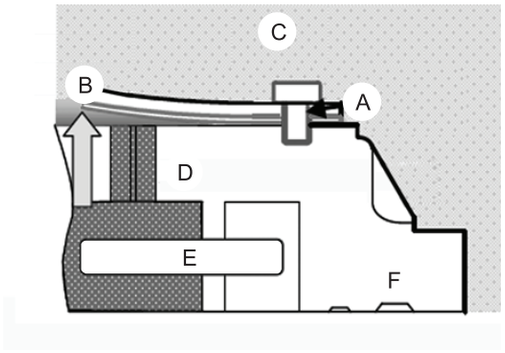
2.5.20 New DC Inverter Scroll Compressor

Compact design

The new HITACHI DC Inverter Scroll compressor is designed to have highers performance at low load operation: +4.6% in seasonal efficiency and as usual to increase efficiency and reliability and to reduce power consumption.

Advantages of the DC Inverter Scroll compressor





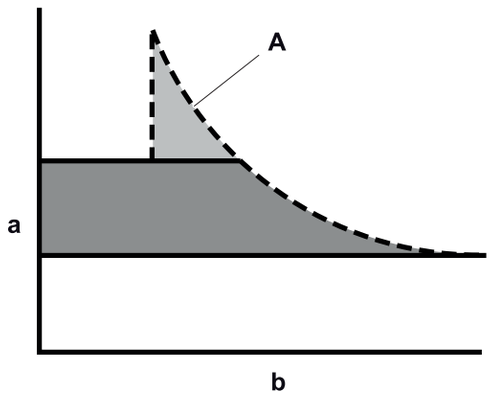
A	Overpressure valve
B	Valve opening
C	Pressure discharge space
D	Hole for overpressure valve
E	Compression space
F	Fixed scroll

The characteristics of the intermediate pressure have improved drastically due to the adoption of an overpressure valve and the optimization of the orbital elevation force of the compressor scroll, which prevents load losses due to leakage. Consequently, the intermediate pressure characteristics are improved and favor energy saving.

TCGB0119_rev2.indb 51 28/02/2018 16:35:38

The overpressure valve enables the pressure to be regulated, increasing the efficiency and reliability of the compressor in the load. This system ensures that the working pressure for the compressor is always optimal, no matter what the charge. The ratio between the discharge pressure (Pd) and the suction pressure (Ps) is optimum, as shown in the diagram.

The heat of the motor is not added to the suction gas before compression, therefore the discharge gas cools the motor correctly. This reduces the temperature of the discharge gas. This is especially important with low suction temperatures.



Lubrication

Taking into account that lubrication is one of the most important points within the life of a compressor, HITACHI has implemented a system based on the pressure differences between suction and discharge. For this purpose it uses a support pump in the base of the compressor. This results in homogenous lubrication in all the moving parts of the compressor, with a high level of reliability in the operating range, even at low frequencies.

Protection against liquid return

The mobile scroll rests in the box when the compressor is idle. When the compressor starts up, the pressure of the chamber under the scroll increases by means of two bleeder holes in the medium pressure section of the compression stroke. This pressure pushes the scroll up and against the cabinet and seals the compression chamber.

If liquid returns to the compressor, the increase in pressure generated pushes the scroll down, thus breaking the seal, allowing the liquid to return to the body of the compressor, where it will evaporate as the temperature is higher.

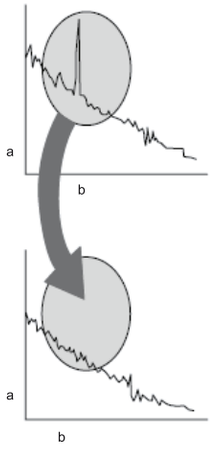
Low noise level for compressor

The Scroll compressor offers a lower level of noise and vibrations because the compression points are distributed uniformly throughout the compression stroke.

The minimum number of components used, along with the compressor sump, which acts as a silencer, improves the reduction in noise.

The sound pattern is high frequency, which enables the use of an insulating roof to make this very low level sound.

a	Noise
b	Frequency (Hz)



2.5.21 Wide range of operating possibilities

The use of SET FREE FSXNSE and FSXNPE units in combination with an air conditioning system for buildings (CS-NET WEB) increases the performance of the installations. For example:

- Program for preventing the continuous operation of the units in empty rooms that allows heating and cooling just before they are occupied.
- Limiting the setting temperatures, which means that the units do not function at maximum capacity if not required for comfort.
- Function interlock from the central control device, which prevents improper or ineffective use of the units.

All these functions, in addition to many more, allow the whole installation to be optimised.

It is worth remembering that, due to the wide range of indoor units, it is always possible to find a unit with the power and the type of installation that best suits your needs.

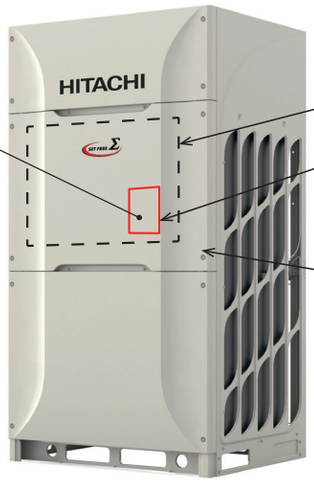
2.6 Maintenance benefits

2.6.1 Improvement of Servicing and Easy Maintenance

Adopting Access Door for Electrical Box Cover

Improve service ability and maintenance performance by adopting access door to electrical box cover. This makes possible to access PCB1 without opening whole electrical box cover.

Access door opened



The following operations are capable from the access door.

- Checking 7-segment and alarm display
- LED operation condition
- PSW, DSW and RSW setting for function selection
- Connecting service checker to TB2 (trasmission terminal block)

NOTE:

1 Be sure to close the access door and return to the original position.
2 Operate the switches and push the buttons with an insulated stick (such as a closed ball-point pen) to avoid electrical shocking.

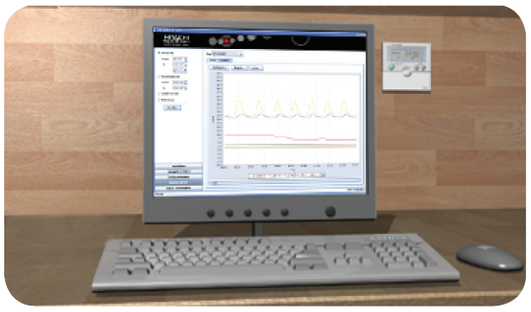
2.6.2 Availability of maintenance tools

◆ HITACHI Service Tools

All installation functions of the HITACHI Service Tools software can also be used for unit maintenance (preventive or corrective). Thanks to this availability, any incident can be detected promptly and resolved as quickly as possible.

In addition, the CSNET-WEB system is a very useful and powerful tool for carrying out maintenance work.

HITACHI has a range of different control systems that can be used with the SET FREE outdoor units. Consult the corresponding Technical Catalogue for controls.



◆ Monitoring the system and simplifying maintenance work

The HITACHI Service Tools software is a very powerful tool for the control and management of HVAC installations. To do so, it supervises the working order of the entire system and displays data that allows for potential incidents to be detected.

Management via software improves the advanced scheduling of planned technical stoppages and means that any unit can be inspected without altering the operation of the air conditioning system. The data obtained is processed and interpreted directly by the software, without the need to waste time or personnel on data reading or on-site checks.

◆ Decrease in operation costs

Monitored operation allows for real-time observation of the performance of the entire air conditioning system. The control system is responsible for ensuring all parts work according to the foreseen conditions, with the maximum performance and efficiency at all times. In this situation, the utmost benefit is obtained from the entire installation at minimum operation costs.

Any range of values tending to be outside that foreseen is an indication of a situation that must be corrected as quickly as possible. The management software clearly displays situations of this type and, therefore, is an interesting ally for reducing costs generated by extraordinary maintenance stoppages.

The more in-depth analysis of the tendencies offers a starting point for realistic maintenance schedules, adapted to the operating conditions of each system.

2.6.3 Simple maintenance

◆ Optimised design to simplify maintenance

The components of the whole range of outdoor units have a robust and durable design. The demanding requirements of the market have been taken into account in terms of reduced maintenance costs.

The interior structure of the units and the layout of the internal elements facilitates any removal and installation work, should, for any reason, technical intervention be necessary.

◆ Minimum or zero maintenance

All equipment and components on the SET FREE range of outdoor units have been designed for minimal, simple and easy maintenance operations.

◆ Loyal to the HITACHI philosophy

The outdoor units of the SET FREE range have been designed in strict compliance with the HITACHI philosophy that ensures the utmost reliability and reduces maintenance tasks to a minimum.

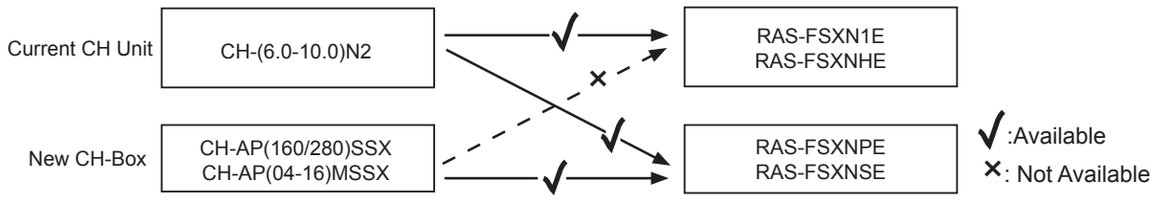
◆ Interchangeability between CH-(6.0-10.0)N2 and CH-AP(160/280)SSX / CH-AP(04-16)MSSX

CH-AP(160/280)SSX / CH-AP(04-16)MSSX and CH-(6.0-10.0)N2 are compatible for RAS-FSXN(P/S)E. However, only the CH-(6.0-10.0)N2 are compatible for RAS-FSXN(1/H)E.



CH-(6.0-10.0)N2 and CH-AP(160/280)SSX / CH-AP(04-16)MSSX can not be used in the same system together.

The production of CH-(6.0-10.0)N2 shall be discontinued, however, it will be supplied for servicing and maintenance until further notice. Contact with your HITACHI dealer or distributor if there are order request for the CH-(6.0-10.0)N2.

4.1 Procedure for selection of the system

This section explains the procedure to select the most suitable outdoor unit in the FSXNSE and FSXNPE series for the SET FREE range, with the values to be taken into account and the necessary steps to be carried out.

This procedure allows to select the unit with the best characteristics to provide the greatest level of efficiency and comfort, considering the building layout, the specifications of the indoor units to be installed and the distribution of air and refrigerant flows.

The ease of access for installation and maintenance work must be taken into account when selecting the location for installation of the outdoor unit.

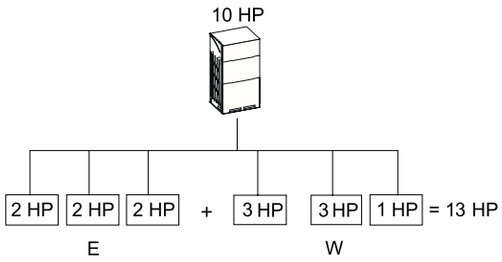
4.1.1 Unique features of the SET FREE system

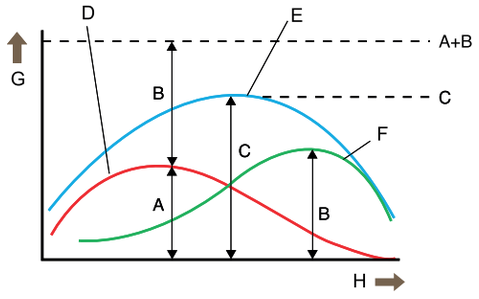
The SET FREE system boasts some unique features that must be taken into account before selecting the outdoor unit.

Possibility of installing a reduced total unit capacity

The SET FREE system allows the connection of a total combined indoor capacity as low as 50% and as high as 130% or 150%, depending on the models, of the nominal capacity of the outdoor unit. In comparison with other air conditioning systems requiring the indoor and outdoor nominal capacities to be equal, the SET FREE system allows the installation of an outdoor unit with a nominal capacity up to 50% smaller than the total combined indoor capacity. This possibility is explained in the following example:

The diagram shows a typical building with a morning peak heat load on the east zone equivalent to a 6 HP unit. In the afternoon, a peak equivalent to a 7 HP unit occurs on the west zone.





Indoor unit capacity
E: East zone (6 HP)
W: West zone (7 HP)

A: morning peak heat load in the eastern area
B: evening peak heat load in the western area
C: maximum simultaneous load for the entire building
D: eastern area load

E: total load
F: western area load
G: load
H: time

In this case, a conventional system would require the installation of a 13 HP outdoor unit, matching the total installed indoor capacity (6 HP + 7 HP). However, the maximum simultaneous load in the whole building occurs at noon, and is equal to 10 HP of unit capacity. Therefore, a 10 HP FSXNPE outdoor unit could be selected, directing its capacity to either the east or the west zone as dictated by the system controls.

NOTE

- *The maximum required loads of east and west zone must not be simultaneous.*
- *In systems in which all the indoor units are operated simultaneously, the total indoor capacity must not exceed the nominal capacity of the outdoor unit. Otherwise, poor performance or a narrowing of the operation range in overload conditions may occur.*

The ratio of total combined horsepower is calculated with the following formula:

Ratio of total combined horsepower= (Total horsepower of the indoor units / Horsepower of the outdoor unit) x 100
= (13 HP / 10 HP) x 100 = **130%**

Power adjustment on indoor units using the DSW

Depending on the actual installation requirements, it may be necessary to adjust the nominal capacity of the indoor units. This is achieved by adjusting a DSW located on the circuit board of the indoor units in the SYSTEM FREE range.

The adjustment of the nominal capacity of the indoor units in the SYSTEM FREE range can be performed at any moment, whereas during installation or commissioning of the system, or at any later time.

The following tables show the nominal capacity of the indoor units as well as the capacities obtained by DSW setting.

4.1.2 Selection parameters

To select the outdoor units, it will be necessary to consult and/or use a series of parameters shown in tables and graphics presented in the different chapters of this catalogue. A summarized list is shown below:

For general data, see chapter *"1. General information"*.

For cooling and heating capacities: *"4.8 Nominal capacity tables"*

For cooling correction factor depending on the piping length: *"4.4.1 Cooling capacity correction factor depending on the pipe length"*.

For heating correction factor depending on the piping length: *"4.4.2 Heating capacity correction factor depending on the pipe length"*.

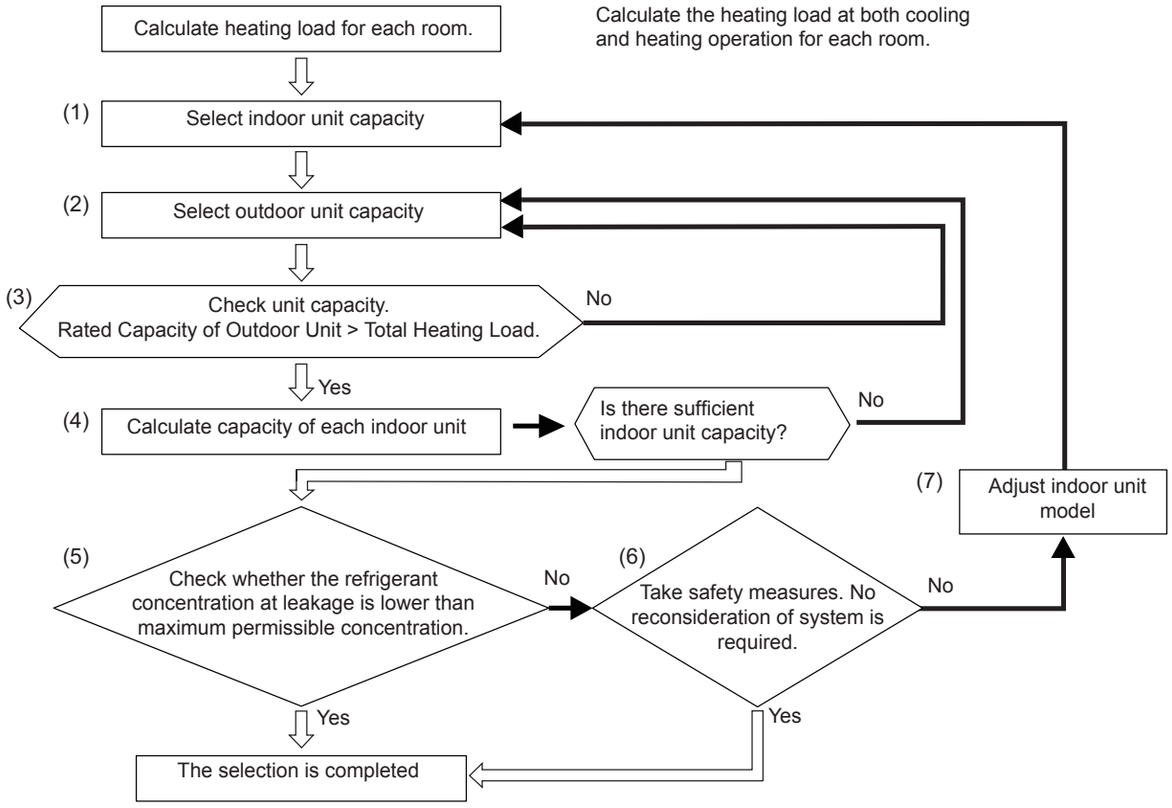
For sensible heat factor: see the technical catalogue for Indoor Units and Complementary Systems

In case of an installation with ducts (outdoor unit with RPI indoor unit) the fan performance for duct calculations should be considered. The RPI units are designed with different static pressure ranges in order to fulfill all installation necessities.

TCGB0119_rev2.indb 103 28/02/2018 16:35:52

4.1.3 Check points for system installation SET FREE FSXNSE and FSXNPE series

For selecting the unit capacity, perform the system selection with checking the refrigerant concentration at leakage in order not to exceed the maximum permissible concentration.



(1) Selecting indoor unit capacity.

Set temporarily the indoor unit model and capacity in each room as following:

Heating Load for each room < Capacity of Indoor Unit

At this time, consider the correction factor according to room temperature.

Then, sum up each indoor unit capacity (The calculation is required for cooling and heating operation).

Indoor unit capacity = Rated capacity x correction Factor (room temperature)

Correction factor according to room temperature: When the estimated load for each room differs from the rated capacity (cooling: 27 ºC DB/19 ºC WB; heating: 20ºC DB), select the outdoor unit capacity at the estimated load from the table “Cooling / Heating capacity tables according to total power of combined indoor units” in this chapter.

Correction Factor (room temperature) = Outdoor unit capacity at estimated load / Rated outdoor unit capacity

(2) Selecting outdoor unit capacity.

Set temporarily the outdoor unit capacity according to the total connectable indoor unit capacity at the item (1).

Then, calculate maximum outdoor unit capacity with considering the correction factors according to temperature condition, piping length and lift, and defrosting correction factor (for heating operation).

The calculation is required for cooling and heating operation

Outdoor unit capacity = Outdoor unit capacity at estimated load x Correction factors (total indoor unit capacity. piping length, defrosting correction factor (for heating operation))

Outdoor unit capacity at estimated load: When calculating heating load for outdoor unit, check the ambient temperature. If the ambient temperature differs from the temperature indicated in the rated capacity (cooling: 35ºC DB; heating: 7ºC DB / 6ºC WB), select the outdoor unit capacity at the estimated load from the table “Cooling / Heating capacity tables according to total power of combined indoor units” in this chapter.

TCGB0119_rev2.indb 104 28/02/2018 16:35:52

Correction factor according to total indoor unit capacity:

- Select the correction factor according to “Capacity Characteristic”.
- Correction factor according to piping length:
- Select the correction factor according to *“4.4 Correction factor depending on the pipe length”*.
- Correction factor according to defrosting condition (for heating operation):
- Select the correction factor according to *“4.5 Correction factor depending on defrost”*.

(3) Checking unit capacity.

Compare the outdoor unit capacity calculated in the item (2) with the capacity of total indoor units calculated in the item (1). The capacity of the whole system is the same as the smaller capacity.

(4) Calculating each indoor unit capacity.

Recalculate the indoor unit capacity as follows. (The calculation is required for cooling and heating operation.)

Unit capacity for each room = Capacity as system (value at item 3) x (indoor unit capacity in concerned room (model) / Total indoor unit capacity (model)

If the outdoor unit capacity is insufficient against the necessary heating load for each room, recalculate it from the item (2) after the outdoor unit capacity is increased.

(5) Checking Refrigerant Concentration at Refrigerant Leakage < Permissible Refrigerant Concentration

(6) Taking Safety Measure (Reconsideration of system is not required.)

(7) Correction of outdoor unit model if the condition of both (5) and (6) are negative.

NOTE

- *Refer to “10.9 Precautions in the event of refrigerant leaks” for items from (5) through (7).*
- *When the temperature is set, consider that the ambient temperature increases by short circuit. Especially, if multiple outdoor units are installed or there is obstacle around the outdoor unit, pay attention to increase the ambient temperature.*
- *For the setting temperature at the heating operation in RPI, RCD and RCI indoor unit type, consider the temperature irregularity between the floor and the ceiling surface. The temperature around the ceiling surface normally becomes 2ºC higher than the floor surface during the heating operation.*
- *For selecting indoor unit capacity, if the sensible heating load is considered, consider the sensible heating ratio together.*
- *In the case that the total indoor unit capacity exceeds the outdoor unit capacity, the temperature is low or the piping length is long, if the indoor unit is operated simultaneously, the air outlet temperature decreases so that may be felt uncomfortably. Therefore, the facility should be designed that the cooling/heating capacity for indoor unit calculated from the cooling/heating capacity for system is more than the heating load.*

4.1.4 Selection procedure example

◆ Given conditions

Once considered the SET FREE system possibilities, it’s the moment to start with the selection procedure. In order to do this, it has been assumed an installation consisting of several rooms with different required cooling loads and temperature conditions.

Total load required for each room

Concept	Room 1	Room 2	Room 3	Room 4	Room 5	Room 6	Room 7
Estimated cooling load (kW)	4.24	5.35	5.35	6.36	8.48	9.60	9.60
Estimated heating load (kW)	4.57	5.75	5.75	6.86	8.92	9.98	9.98

Temperature condition

Operating conditions		Cooling	Heating
Indoor air inlet temperature	DB	27.0 °C	20.0 °C
	WB	19.0 °C	—
Outdoor air inlet temperature	DB	30.0 °C	1.0 °C
	WB	—	0.0 °C

DB: dry bulb; WB: wet bulb.

In this example, the maximum required loads will not be simultaneous.

TCGB0119_rev2.indb 105 28/02/2018 16:35:52

Piping dimensions:

- Equivalent pipe length between outdoor unit and indoor units: 60 m.
- Pipe height: 25 m.
- Cooling capacity correction factor depending on the pipe length =0.90.
- Heating capacity correction factor depending on the pipe length =0.95.
- Heat recovery system (3 pipes)

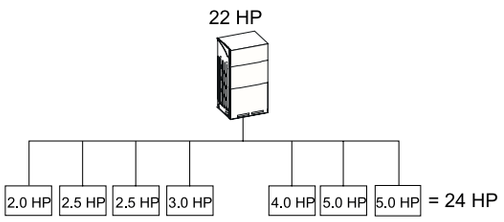
◆ Appropriate selection of indoor units and nominal capacity

Example: selection of RPI ducted indoor units.

The pre-selected capacity of the different indoor units has not been the immediately higher in all the units, in order to apply a safety factor considering the different correction factors existing, which will reduce the capacity.

Concept	Room 1	Room 2	Room 3	Room 4	Room 5	Room 6	Room 7
Model selected	RPI-2.0 FSN5E	RPI-2.5 FSN5E	RPI-2.5 FSN5E	RPI-3.0 FSN5E	RPI-4.0 FSN5E	RPI-5.0 FSN5E	RPI-5.0 FSN5E
Nominal cooling load (kW)	5.6	7.1	7.1	8.0	11.2	14.0	14.0
Nominal heating load (kW)	6.3	8.5	8.5	9.0	12.5	16.0	16.0

Then, it's shown a diagram of the installation resulting:



The resulting total indoor unit horsepower is 24 HP. The outdoor unit with the exact horsepower is the 24 HP model, but the possibility "Reduced total outdoor unit capacity" allows the 22 HP model selection. Thus, it's allowed at the outdoor unit to be up to 10% smaller capacity when compared with other air conditioning systems.

Total combination horsepower = (Total indoor unit horsepower / Outdoor unit horsepower) x 100 =
= (24 HP / 22 HP) x100 ≈ **110%**

NOTE

The maximum simultaneous load on the installation must not be higher than 22 HP for this example.

Select Standard serie or High efficiency serie. For this example High efficiency serie has been chosen.

To determine the outdoor unit pre-selected nominal cooling and heating capacity, it's necessary refer to section "Nominal cooling / heating capacity tables" in this chapter, taking into account Outdoor unit series (Standard or High efficiency type), model (RAS - 22FSXNPE), the total horsepower combination (110%) and the temperature condition.

Concept	Room 1+2+3+4+5+6+7 (24 HP)	Outdoor unit pre-selected (22 HP~110%)
Total nominal cooling load (kW)	67	62.73
Total nominal heating load (kW)	76.8	63.53

NOTE

- *If the air inlet temperature for the indoor unit or outdoor unit is not contained in the capacity tables, an interpolation should be carried out using the values above and below those of the air inlet temperature.*
- *If the total combination horsepower is not shown in the capacity tables (for example, 114%), an interpolation should be carried out using the values above and below (120% and 110%) those of the total combination*

Next step will be the capacity correction using the different correction factors shown in this chapter.

◆ Actual capacity of the outdoor unit

Actual maximum capacity of the outdoor unit = (nominal capacity of the outdoor unit) x (correction factor according to pipe length and height) x (correction factor according to temperature)

TCGB0119_rev2.indb 106 28/02/2018 16:35:52

See “Nominal cooling / heating capacity tables” in this chapter for the nominal capacity at the total horsepower of combined indoor units.

See *“4.4.1 Cooling capacity correction factor depending on the pipe length”* and *“4.4.2 Heating capacity correction factor depending on the pipe length”* for the correction factor according to the pipe length.

Cooling: (62.73 kW) x (0.90) = 56.46 kW.

Heating: (63.53 kW) x (0.95) x (0.85) = 51.3 kW.

Actual capacity of each indoor unit.

Actual capacity of each indoor unit = (actual capacity of the outdoor unit) x (power value of each range of indoor units / sum of the power of each indoor unit)

Example:

RPI-2.0FSN5E

Cooling: 56.46 × (2.0 HP / (2.0 HP + 2.5 HP + 2.5 HP + 3.0 HP +4.0 HP + 5.0 HP + 5.0 HP)) = 4.70 kW.
Heating: 51.3 × (2.0 HP / (2.0 HP + 2.5 HP +2.5 HP + 3.0 HP + 4.0 HP + 5.0 HP + 5.0 HP)) = 4.27 kW.

RPI-2.5FSN5E

Cooling: 56.46 × (2.5 HP / (2.0 HP + 2.5 HP + 2.5 HP + 3.0 HP +4.0 HP + 5.0 HP + 5.0 HP)) = 5.88 kW.
Heating: 51.3× (2.5 HP / (2.0 HP + 2.5 HP + 2.5 HP + 3.0 HP + 4.0 HP + 5.0 HP + 5.0 HP)) = 5.34 kW.

As can be seen, the actual total cooling and heating capacity are higher than the estimated total cooling and heating load. Therefore, it can be said that the RAS-22FSXNPE unit meets the minimum cooling and heating requirements set for the system.

NOTE

If the actual total cooling / heating capacity calculated is lower than the estimated total cooling / heating load, the calculation must be done again with the unit immediately higher.

4.1.5 Selection procedure example with HYDRO FREE models

◆ Given conditions

Once considered the SET FREE system possibilities, it's the moment to start with the selection procedure. In order to do this, it has been assumed an installation consisting of several rooms with differents required cooling loads and temperature conditions.

Total load required for each room

Concept	Room 1	Room 2	Room 3	Room 4	Room 5	Room 6	HYDRO FREE
Estimated cooling load (kW)	4.24	5.35	5.35	6.36	8.48	10.60	10.50
Estimated heating load (kW)	4.57	5.75	5.75	6.86	8.92	11.50	9.00

Temperature condition

Operating conditions		Cooling	Heating
Indoor air inlet temperature	DB	27.0 °C	20.0 °C
	WB	19.0 °C	—
Outdoor air inlet temperature	DB	30.0 °C	1.0 °C
	WB	—	0.0 °C

DB: dry bulb; WB: wet bulb.

In this example, the maximum required loads will not be simultanious.

Piping dimensions:

- Equivalent pipe length between outdoor unit and indoor units: 60 m.
- Pipe height: 25 m.
- Cooling capacity correction factor depending on the pipe length =0.90.
- Heating capacity correction factor depending on the pipe length =0.95.
- Heat recovery system (3 pipes)

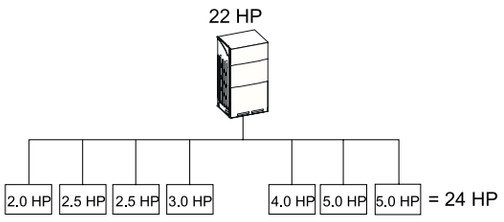
◆ Appropriate selection of indoor units and nominal capacity

Example: selection of RPI ducted indoor units.

The pre-selected capacity of the different indoor units has not been the immediately higher in all the units, in order to apply a safety factor considering the different correction factors existing, which will reduce the capacity.

Concept	Room 1	Room 2	Room 3	Room 4	Room 5	Room 6	HYDRO FREE
Model selected	RPI-2.0 FSN5E	RPI-2.5 FSN5E	RPI-2.5 FSN5E	RPI-3.0 FSN5E	RPI-4.0 FSN5E	RPI-5.0 FSN5E	RWLT-5.0VN1E
Nominal cooling load (kW)	5.6	7.1	7.1	8.0	11.2	14.0	13.2
Nominal heating load (kW)	6.3	8.5	8.5	9.0	12.5	16.0	12.9

Then, it's shown a diagram of the installation resulting:



The resulting total indoor unit horsepower is 24 HP. The outdoor unit with the exact horsepower is the 24 HP model, but the possibility "Reduced total outdoor unit capacity" allows the 22 HP model selection. Thus, it's allowed at the outdoor unit to be up to 10% smaller capacity when compared with other air conditioning systems.

Total combination horsepower = (Total indoor unit horsepower / Outdoor unit horsepower) x 100 =
= (24 HP / 22 HP) x100 ≈ **110%**

NOTE

The maximum simultanious load on the installation must not be higher than 22 HP for this example.

TCGB0119_rev2.indb 108 28/02/2018 16:35:53

Select Standard serie or High efficiency serie. For this example High efficiency serie has been chosen.

To determine the outdoor unit pre-selected nominal cooling and heating capacity, it's necessary refer to section "Nominal cooling / heating capacity tables" in this chapter, taking into account Outdoor unit series (Standard or High efficiency type), model (RAS - 22FSXNPE), the total horsepower combination (110%) and the temperature condition.

Concept	Room 1+2+3+4+5+6+7 (24 HP)	Outdoor unit pre-selected (22 HP~110%)
Total nominal cooling load (kW)	66.2	63.8
Total nominal heating load (kW)	73.7	64.9

NOTE

- *If the air inlet temperature for the indoor unit or outdoor unit is not contained in the capacity tables, an interpolation should be carried out using the values above and below those of the air inlet temperature.*
- *If the total combination horsepower is not shown in the capacity tables (for example, 114%), an interpolation should be carried out using the values above and below (120% and 110%) those of the total combination*

◆ Defrost factor

Due to frost build-up during heating, defrost is needed so capacity is reduced.

Defrost time is affecting overall capacity so capacity correction is necessary.

Correction heating capacity = Correction factor x heating capacity

Outdoor inlet air temp.(ºC DB) (HR=85%)	-7	-5	-3	0	3	5	7
Defrost correction factor (fd)	0.95	0.93	0.88	0.85	0.87	0.90	1.0

Outdoor inlet air temp.(ºC DB)=1, then Defrost correction factor (fd)= 0.857.

◆ Actual capacity of the outdoor unit

Actual maximum capacity of the outdoor unit = (nominal capacity of the outdoor unit) x (correction factor according to pipe length and height) x (correction factor according to temperature)

See "Nominal cooling / heating capacity tables" in this chapter for the nominal capacity at the total horsepower of combined indoor units.

See *"4.4.1 Cooling capacity correction factor depending on the pipe length"* and *"4.4.2 Heating capacity correction factor depending on the pipe length"* for the correction factor according to the pipe length.

Cooling: (63.8 kW) x (0.90) = 57.42 kW.

Heating: (64.9 kW) x (0.95) x (0.857) = 52.84 kW.

◆ Actual capacity of each indoor unit

Actual capacity of each indoor unit = (actual capacity of the outdoor unit) x (power value of each range of indoor units / sum of the power of each indoor unit)

RPI-2.0FSN5E

Cooling: 57.42 × (2.0 HP / (2.0 HP + 2.5 HP + 2.5 HP + 3.0 HP +4.0 HP + 5.0 HP + 5.0 HP)) = 4.78 kW.
Heating: 52.84 × (2.0 HP / (2.0 HP + 2.5 HP +2.5 HP + 3.0 HP + 4.0 HP + 5.0 HP + 5.0 HP)) = 4.40 kW.

Heating: 52.84 × (4.0 HP / (2.0 HP + 2.5 HP +2.5 HP + 3.0 HP + 4.0 HP + 5.0 HP + 5.0 HP)) = 8.81 kW.

Cooling: 57.42 × (5.0 HP / (2.0 HP + 2.5 HP + 2.5 HP + 3.0 HP +4.0 HP + 5.0 HP + 5.0 HP)) = 11.96 kW.

Available capacity for HYDRO FREE

Cooling: 57.42 – 4.78 – 5.98 – 5.98 – 7.18 – 9.57 – 11.96 = 11.97 kW.

The results of the calculation are the nearest to the requirements of the installation, and therefore the selection of units is considered to be optimal.

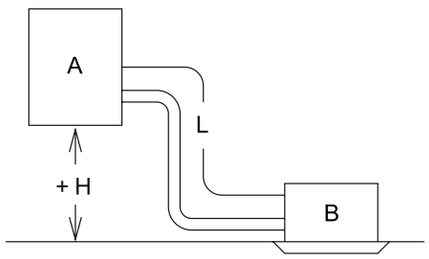
4.4 Correction factor depending on the pipe length

4.4.1 Cooling capacity correction factor depending on the pipe length

The cooling capacity must be corrected according to the following formula:

CCA = CC x F
CCA: Current corrected cooling capacity.
CC: Cooling capacity (value obtained in *"5.1 Cooling capacity tables according to total power of combined indoor units"*).
F: correction factor depending on the equivalent pipe length.

The correction factors are shown in the following figure:



A: Outdoor unit.

B: Indoor unit.

L: Current length of a single pipe between the indoor unit and the outdoor unit, in meters.

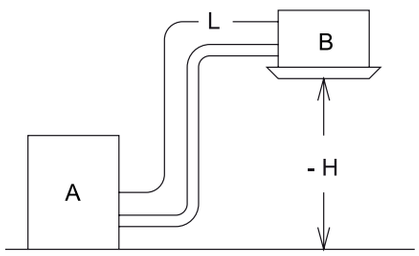
EL: total equivalent distance between the indoor unit and outdoor unit, in meters (equivalent to the length of a single pipe).

Equivalent pipe length for:

- 90° union elbow: 0.5 m.
- 180° curve: 1.5 m.
- One Multi-kit: 0.5 m.

H: vertical distance between indoor unit and outdoor unit, in meters.

H > 0: position of the outdoor unit higher than the indoor unit.



NOTE

- *If the distance EL is greater than 100 m in Heat Pump systems (2 pipes), increase the gas and liquid refrigerant pipes by one size.*
- *If the distance EL is greater than 100 m in Heat Recovery systems (3 pipes), increase the liquid pipe by one size.*
- *In Heat Recovery systems (3 pipes), the dotted line for the cooling capacity correction factor indicates that all the indoor units function in cooling mode. Even if one of the indoor units functions in heating mode, the value shall be indicated by the continuous line.*

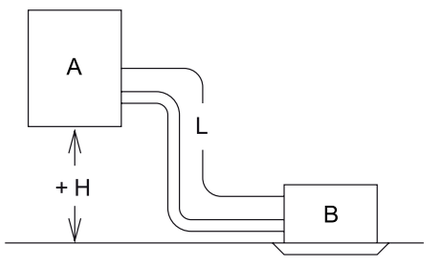
4.4.2 Heating capacity correction factor depending on the pipe length

The heating capacity must be corrected according to the following formula:

HCA = HC x F
HCA: Current corrected heating capacity.
HC: Heating capacity (value obtained in chapter *"5.2 Heating capacity tables according to total power of combined indoor units"*)
F: correction factor depending on the equivalent pipe length.

The correction factors are shown in the following figure:



Equivalent pipe length for:

90° union elbow: 0.5 m.

180° curve: 1.5 m.

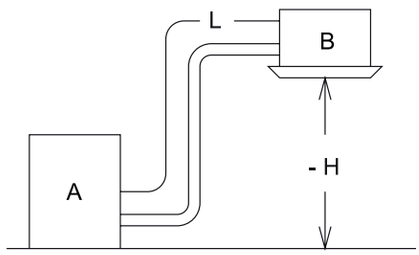
One Multi-kit: 0.5 m.

H: vertical distance between indoor unit and outdoor unit, in meters.

EL: total equivalent distance between the indoor unit and outdoor unit, in meters (equivalent to the length of a single pipe).

H > 0: position of the outdoor unit higher than the indoor unit.

L: current length of a single pipe between the indoor unit and the outdoor unit, in meters.



NOTE

- *If the distance EL is greater than 100 m in Heat Pump systems (2 pipes), increase the gas and liquid refrigerant pipes by one size.*
- *If the distance EL is greater than 100 m in Heat Recovery systems (3 pipes), increase the liquid pipe by one size.*

4.5 Correction factor depending on defrost

The heating capacity described in the preceding section excludes running in periods of frost or defrost operation.

In reference to running in frost or defrost operation, the heating capacity is corrected with the following equation:

Corrected heating capacity = (correction factor) x (heating capacity)

Inlet air temperature in the outdoor heat exchanger (°C DB) (Humidity = 85% RH)	-7	-5	-3	0	3	5	7
Correction factor	0.95	0.93	0.88	0.85	0.87	0.90	1.0

NOTE

- *DB: dry bulb.*
- *The correction factor in defrost function is not applicable in special conditions, such as snowfall or operation during transient periods.*

4.6 Correction factor depending on the altitude

This capacity is impacted by the altitude.

Altitude	m	0	300	600	900	1200	1500	1800	2000
Correction factor		1.00	0.97	0.93	0.90	0.87	0.84	0.81	0.81

6.1 Overall sound level

1 The sound pressure level was measured under the following conditions:

a. 1 m from the surface of the unit's service cover and 1.5 m from floor level.

b. The provided data corresponds to cooling mode. In the case of heating mode, the sound pressure level increases from 1 to 2 dB(A).

c. The provide data has been measured in an anechoic chamber, so the reflected sound must be taken into account for installation.

2 Sound power levels were measured in a reverberant room, in accordance with the EN12102 standard. Used environment conditions are the same as specified in EN14511 for performance test.

6.4 Sound pressure of CH-Box (Only for heat recovery system)

1 The readings were taken in an anechoic chamber. Operation sound in actual conditions may become larger due to ambient noise or echo from the surroundings. Noise sources must be taken into consideration when looking for a proper installation location.

2 CH-Box operation sound may be heard even if the indoor unit has stopped, while the outdoor units are in operation and the other indoor units are in thermo-ON.

3 “Operation Sound” stands for the CH-Box operation sound when the entire system is either in cooling operation or in heating operation (Not in simultaneous cooling and heating operation).

4 “Maximum Sound” is the maximum value of CH-Box operation sound while the unit is in simultaneous cooling and heating operation or in defrosting operation.

5 “Maximum Sound” may be exceeded during transient operation such as switching to defrosting mode. This must be taken into account when selecting the place installation. The CH-Box should not be installed in places near bedrooms or hospital rooms. (Refer to the Installation Manual for details)

7.1 Voltage supply

Service voltage

Between 90 and 110% of the rated voltage.

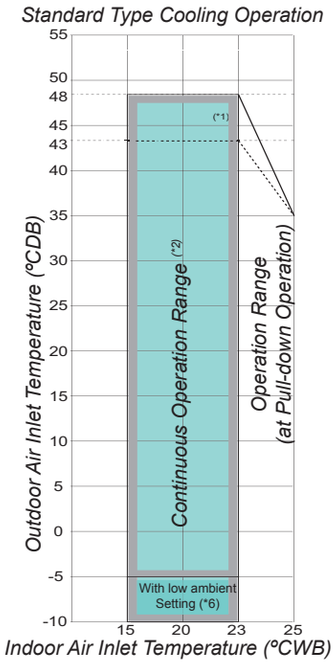
Start-up voltage

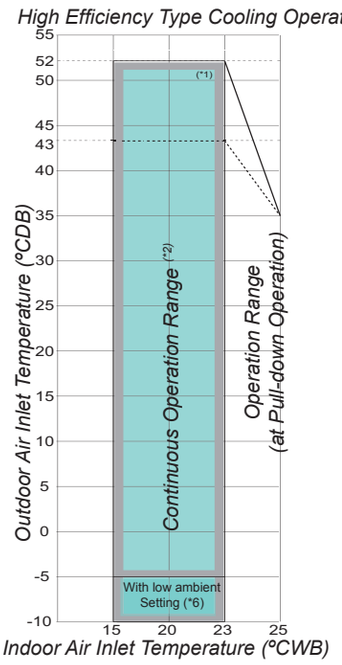
Between 85 and 115% of the rated voltage.

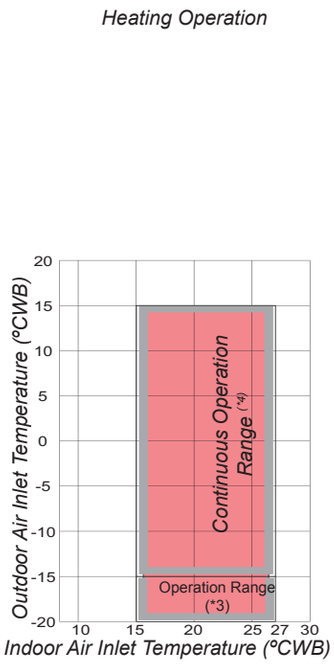
Voltage imbalance

Up to 3% in each phase, measured at the main terminal of the outdoor unit.

7.2 Working range







This unit has been designed for cooling operation under low ambient temperatures down to -10ºC. This feature enables cooling to be obtained even in winter in buildings with high internal heat gains due to lighting, people and machines, particularly in areas such as shops, lecture rooms, data processing areas, etc. And the heating operation under low ambient temperature down to -20ºC can also be performed. The system can provide refrigeration or heating (heat pump system) or can provide refrigeration and heating simultaneously (heat recovery system). This heat pump and heat recovery system has been designed for the following temperatures. Use the system within this range(*5):

Operation		Cooling		Heating
Indoor temperature	Min.	21 °C DB / 15 °C WB		15 °C DB
	Max.	32 °C DB / 23 °C WB		27 °C DB
Outdoor temperature	Min.	-10 °C DB		-20 °C WB
	Max.	Standard type: High Efficiency type:	48 °C DB(*1) 52 °C DB(*1)	15 °C WB

NOTE

DB: dry bulb; WB: wet bulb.

**1.*

- *a Cooling operation at maximum 48°C DB (for standard type) and 52°C DB (for high efficiency type) should be available only if the outdoor air inlet temperature increase temporarily according to the installation condition.*
- *b If install the units to the place where exceed ambient temperature 43°C continuously, the combination ratio must be lower 130% and not to operate all of the indoor unit simultaneously.*
- *c The cooling capacity is deteriorated at high ambient temperature. Select the larger capacity outdoor unit than compatible building heat load.*
- *d The appropriate amount (100%) of refrigerant must be charged. Excessive charging of refrigerant is forbidden.*
- *e It must be avoided to install the units where affected by direct sunlight reflection and short circuit. There may be the possibility to activate protection control and alarm system if install the units to inappropriate place. Also the life time of the products and parts must be considerably shortened.*
- *f Periodic maintenance (1/certain month) must be applied to the heat exchanger fin to avoid adhesion of dirt and clogging of sand to the outdoor unit heat exchanger.*

**2. There might be the possibility of thermo-OFF when cooling load is low and outdoor air inlet temperature is 10°C DB or lower to prevent frost formation on indoor unit heat exchanger.*

**3. Indoor air inlet temperature at heating operation under 15°C to 27°C WB is under assumption of limited time operation such as at the time of startup in the early morning and not suitable for long time continuous operation.*

**4. There might be the possibility of thermo-OFF when heating load is low and outdoor air inlet temperature is high (higher than 15°C DB) to prevent the outdoor unit. The outdoor unit operation stops at when outdoor air inlet temperature exceed 26°C DB.*

**5. Operational range is different when connect to All Fresh Air Unit, Econofresh, and other special indoor units. Refer to the respective technical catalogue for the detail.*

**6. In case cooling operation or simultaneous operation under the inlet air temperature -5°C or lower the conditions below must be considered at the time of installation.*

- *a Make sure to apply Snow Protection Hood ((field supplied optional parts)).*
- *b The minimum capacity of connectable indoor unit is 2.5HP.*
- *c Set the function “Cooling Operation under Low Load Operation” (DSW6) from the outdoor unit (If multiple outdoor units are connected in a system, set the function only for outdoor unit A).*
- *d Do not use the function if the total capacity of the outdoor unit connected in a system is 56HP or larger.*

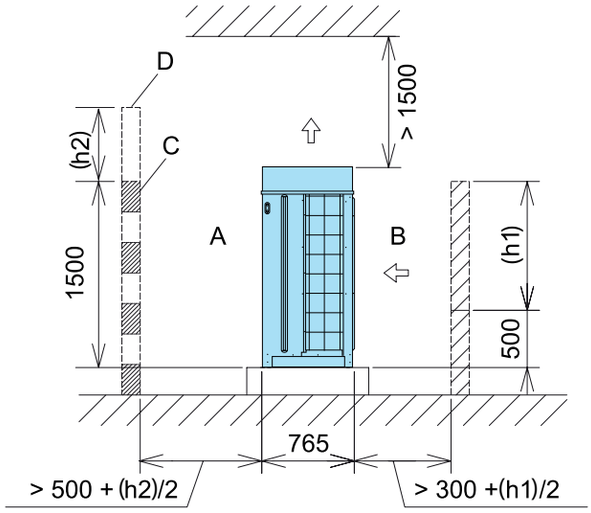
8.5 Service space for outdoor unit



NOTE

Side view. All measurements are in mm.

Calculate the service space required during the installation of the unit, based on the following:

- If there are no walls in front or rear side of the unit, a space of 500 mm is necessary in front side -A- and 300 mm rear side -B-.
- If the front wall is higher than 1500 mm, a space of (500 + (h2)/2) mm is required at the front -A-.
- If the rear wall is higher than 500 mm, a space of (300 + (h1)/2) mm is required at the rear side -B-.
- If a wall -D- is installed in front of the unit, a ventilation hole -C- should be made in the wall. Distributed simetrically and proporcionally along the wall.
- When the space over the unit is less than 1500 mm, or the space above the unit is closed, a duct is required to prevent short-circuits in the air outlet side.
- If there are any obstacles in the space over the unit, the four sides of the unit should be left open.

a. Installation with walls in two directions

If the units installed are adjacent to high buildings, without walls in two directions, a space of 300 mm is required at the rear side of the unit.

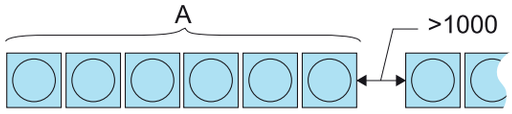
◆ Considerations

- The dimensions considered in the figures include the space necessary for typical installation, and maintenance work for operation in refrigeration mode at an outdoor temperature of 35 °C.
  If the outdoor temperature is higher and if there is a possibility of a short circuit between the inlet and outlet air, locate the most suitable dimensions by calculating the air flow current in comparison with the dimensions given.
- For installation in several groups, a maximum of six units (A) one metre apart can be grouped.



- If the unit is surrounded by walls on all four sides, keep one of the walls partially open.
- Keep the upper side open to prevent mutual interference of inlet and outlet air for each outdoor unit.

10.1 Refrigerant pipe selection

Select the pipe size in line with the following instructions:

1 Between the outdoor unit and the branch pipe (Multi-kit): select the same pipe connection size as for the outdoor unit.
2 Between the branch pipe (Multi-kit) and the indoor unit: select the same pipe connection size as for the indoor unit.

⚠ CAUTION

- *Do not use refrigerant pipe sizes other than those indicated in this manual. The diameter of the refrigerant pipes depends directly on the power of the outdoor unit.*
- *If larger diameter refrigerant pipes are used, the circuit lubrication oil tends to separate from the gas carrying it. The compressor will be seriously damaged due to a lack of lubrication.*
- *If smaller diameter refrigerant pipes are used, the gas or liquid refrigerant will have serious difficulties in circulating. System performance will be affected. The compressor will run under more severe conditions than foreseen and will be damaged in a short space of time.*
- *The copper pipe used in the refrigeration installations is different to the copper pipe used in installations carrying domestic or heating water.*
- *The copper pipe for refrigeration installations is especially treated for outdoors and indoors. The interior surface finish makes it easier for the refrigerant to circulate and withstands the action of the lubricant oil used in outdoor units.*

Prepare the copper pipes provided by the supplier.

Select the pipe with the appropriate diameter and thickness. Use the table below to select the most appropriate pipe:

Nominal diameter		Thickness mm	Supply	Alternative pipe and reducer
mm	Inches			
Ø6.35	1/4	0.80	Coil	-
Ø9.52	3/8	0.80	Coil	(Ø9.52-Ø12.7)
Ø12.7	1/2	0.80	Coil	(Ø12.7-Ø15.88)
Ø15.88	5/8	1.00	Coil	(Ø15.88-Ø19.05)
Ø19.05	3/4	1.00	Straight lengths	(Ø19.05-Ø22.2)
Ø22.2	7/8	1.00	Straight lengths	(Ø22.2-Ø25.4)
Ø25.4	1	1.00	Straight lengths	(Ø25.4-Ø28.58)
Ø28.58	1-1/8	1.00	Straight lengths	(Ø28.58-Ø31.75)
Ø31.75	1-1/4	1.10	Straight lengths	(Ø31.75-Ø34.9)
Ø38.1	1-1/2	1.35	Straight lengths	(Ø38.1-Ø41.3)
Ø41.3	1-5/8	1.45	Straight lengths	-
Ø44.45	1-3/4	1.55	Straight lengths	-
Ø50.8	2	1.78	Straight lengths	-

NOTE

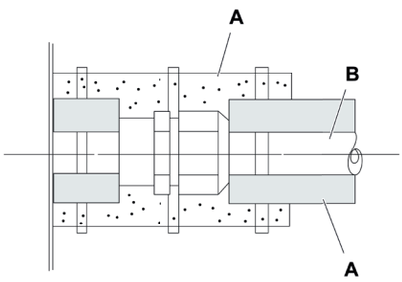
If the main refrigerant pipe specified in the tables is not available at the installation location, select the size given in brackets. In this case, prepare a suitable reducer.

Always use clean copper pipes with no signs of knocks or cracks. Make sure there is no dust or dampness on the inside. Before you install the pipes, clean the inside with oxygen-free nitrogen gas to eliminate any remains of dust or other substances.

⚠ CAUTION

- *Do not use hand saws, circular saws, abrasive grinders or other tools that generate shavings.*
- *Strictly follow national or local regulations regarding occupational health and safety.*
- *Wear appropriate means of protection during cutting or brazing operations and installation (gloves, eye protection, etc).*
- *When brazing pipe is made, protect the surrounding elements of the area where you are working in order to avoid damage due to the flame high temperature.*

TCGB0119_rev2.indb 749 28/02/2018 17:11:20



On completing the installation of the refrigerant pipes -B-, insulate them appropriately using suitable insulating material -A- and seal the open space between the holes made and the pipe, as shown in the figure.

Cover the end of the pipe appropriately when it is to be inserted through holes in walls and roofs, etc.

Keep the ends of the pipes covered while other installation work is being carried out to avoid the entry of dampness or dirt.

Do not place the pipes directly on the ground without appropriate protection or adhesive vinyl tape to cover the ends.

Where the pipe installation is not completed for a certain amount of time, braze the ends of the pipe to seal. Then fill it with oxygen-free nitrogen gas through a Schrader valve to avoid the accumulation of humidity and/or contamination through dirt.

NOTE

- *Where polyethylene foam insulation is used, a 10 mm thick layer should be used for the liquid pipe and between 15 and 20 mm for the gas pipe.*
- *Install the insulation after the pipe surface temperature has dropped to the same temperature as that of the room, otherwise the insulation may melt.*

Do not use insulating material that contains NH_3 (ammonium), as it could damage the copper in the pipe and subsequently cause leaks.

Where the installer has supplied his own branches, these should be appropriately insulated to avoid decreases in capacity in line with to environmental conditions and dew on the surface of the piping due to low pressure.

10.4 Precautions for the installation of the outdoor unit

◆ Order of installation of the units

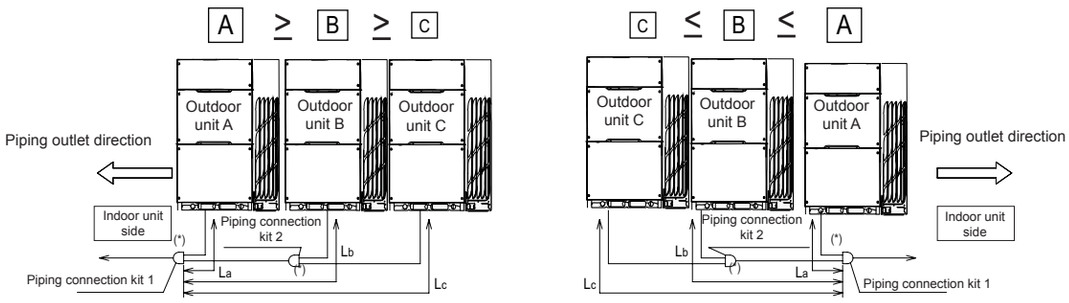
When the installation and piping work for the multiple outdoor units are performed, it is required that the arrangement for outdoor units and piping length be determined. Perform securely the installation work according to the following restrictions. If the arrangement for outdoor units is incorrect, it may cause flowback of the refrigerant and result in failure of outdoor unit.

Restrictions for 2 and 3 Units Combination

1 For 2 and 3 outdoor units combination, align the outdoor units from largest capacity to smallest as A > B > C and outdoor unit “A” should be connected to the piping connection kit 1.

2 The piping length between the piping connection kit 1 and the outdoor unit should be La < Lb < Lc < 10m.

3 For maintenance, attach “Main unit label” to the service cover (back side surface) of the outdoor unit “A”.



(*): Keep the straight-line distance of 500 mm or more for piping after the piping connection kit.

10

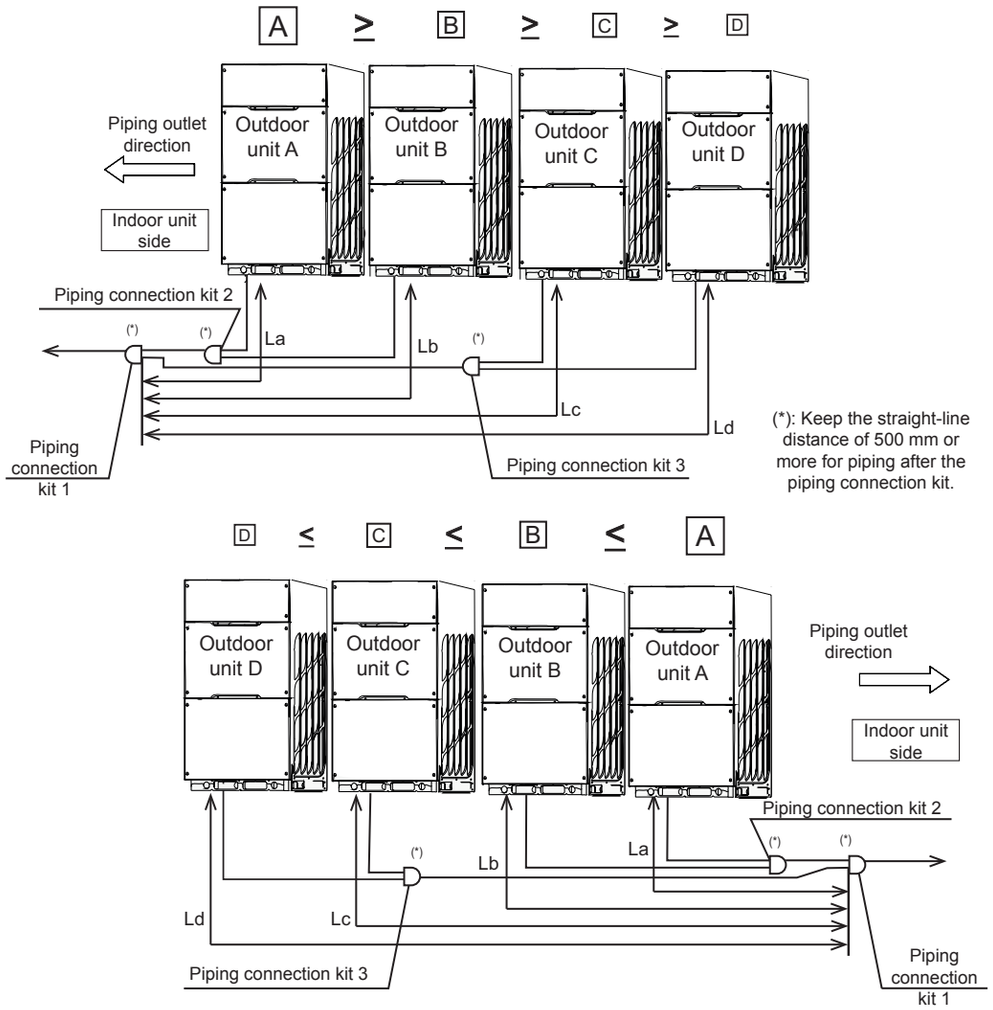
TCGB0119_rev2.indb 759 28/02/2018 17:11:34

Restrictions for 4 Units Combination

1 For 4 outdoor unit combination, align the outdoor units from largest capacity to smallest as A > B > C > D. The outdoor units “A” and “B” should be connected to the piping connection kit 2 and the outdoor unit “C” and “D” should be connected to the piping connection kit 3.

2 The piping length between the piping connection kit 1 and each outdoor unit should be La < Lb < Lc < Ld < 10m.

3 For maintenance, attach the main unit label to the service cover (back side surface) of the outdoor unit “A”.



◆ Refrigerant pipe installation between outdoor units

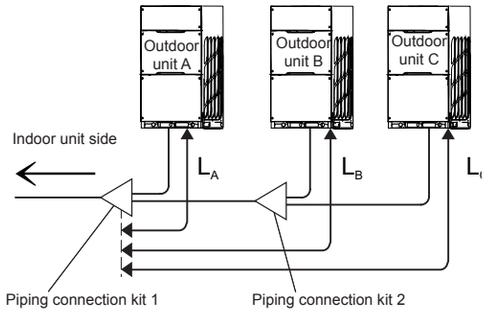
For refrigerant piping work, the optional piping connection kit is required to branch the pipe between outdoor units.

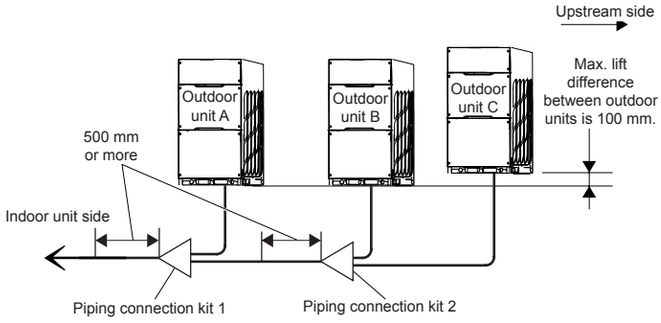
The arrangement for outdoor units should be determined depending on the piping direction when the refrigerant piping work and installation work are planned. When the outdoor unit is installed, perform the installation work according to the following restrictions.

TCGB0119_rev2.indb 760 28/02/2018 17:11:35

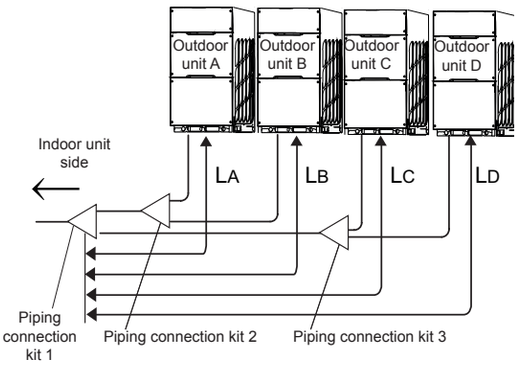
1 Keep the straight-line distance of 500 mm or more after the piping connection kit.

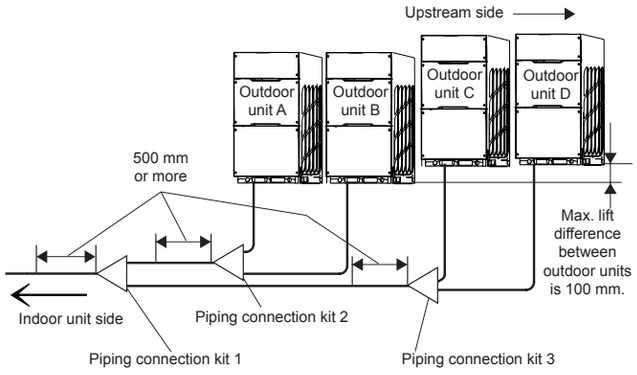
- 2 and 3 Units Combination





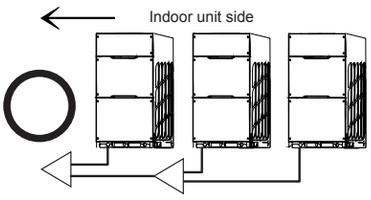
- 4 Units Combination

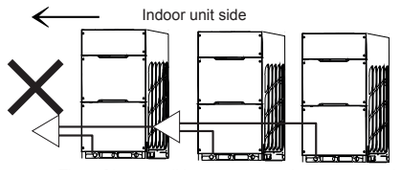


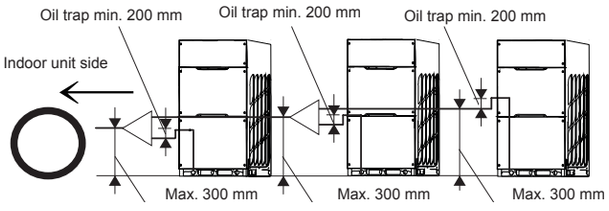


2 Place the piping connection kit lower than the outdoor unit piping connection.
In case that the piping connection kit is placed higher than the outdoor unit piping connection, keep 300mm (max.) between the piping connection kit and the bottom of the outdoor unit. Also, provide the oil trap (min. 200mm) between the piping connection kit and the outdoor unit.

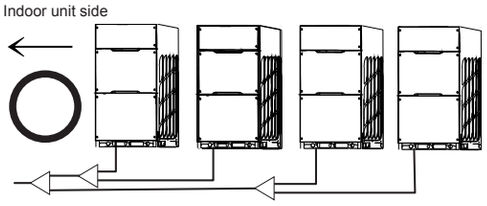
- 2 and 3 Units Combination

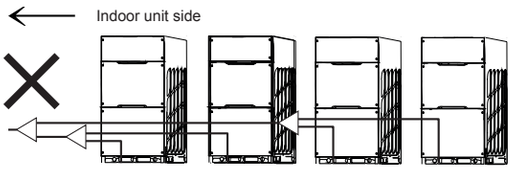


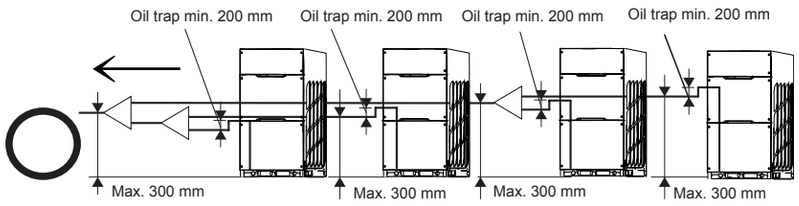




- 4 Units Combination







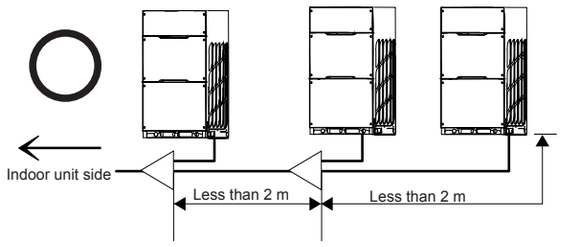
10

TCGB0119_rev2.indb 761 28/02/2018 17:11:39

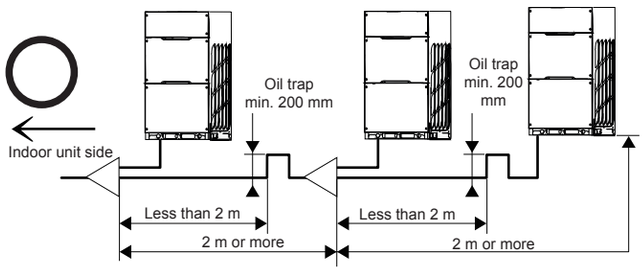
3 In case that the piping length between outdoor units is 2m or more, the oil trap for the gas pipe should be provided so that accumulation of refrigerant oil may not occur.

- 2 and 3 Units Combination

Less than 2m

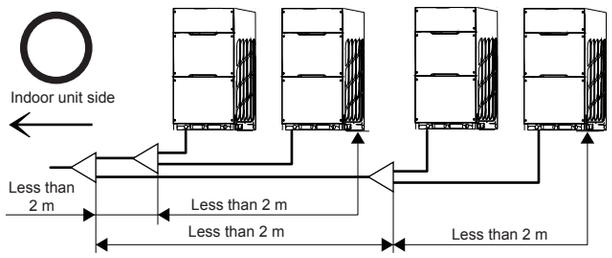


2m or more

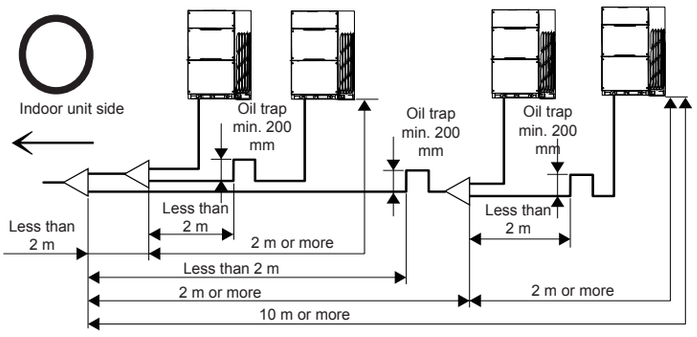


- 4 Units Combination

Less than 2m

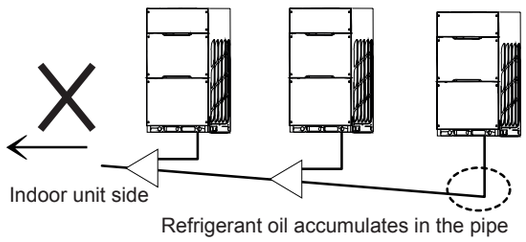


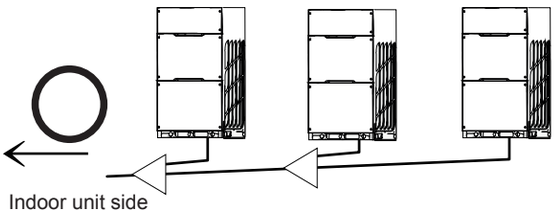
2m or more



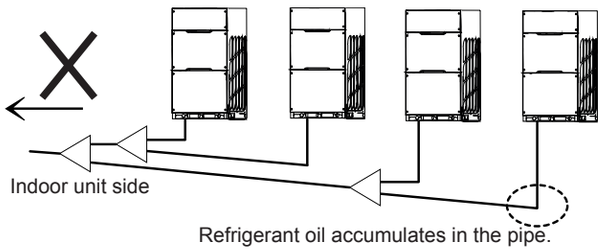
4 Place the outdoor unit pipe horizontally or with the pipe slanted downward towards the indoor unit side so that accumulation of refrigerant oil may not occur in the pipe.

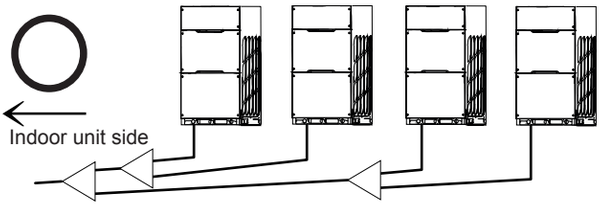
- 2 and 3 Units Combination





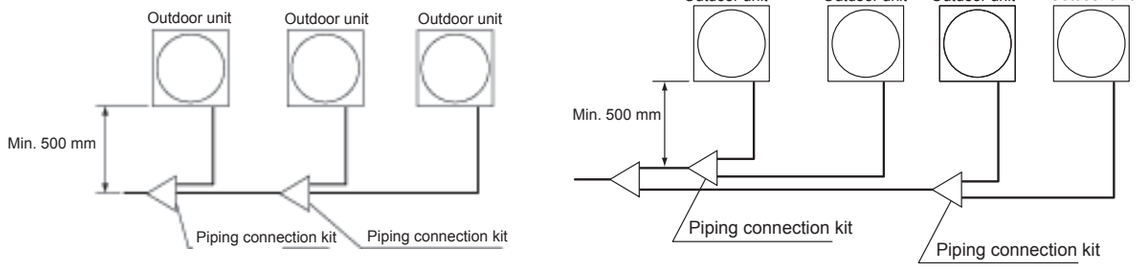
- 4 Units Combination





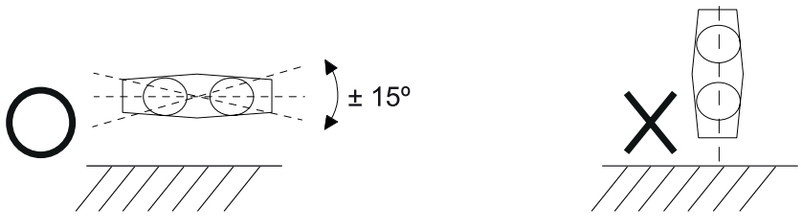
TCGB0119_rev2.indb 762 28/02/2018 17:11:42

5 For servicing, in case that the pipe is placed frontward of the outdoor unit, secure min. 500 mm between the outdoor unit and piping connection kits. (When the compressor is replaced, a space of min. 500 mm is required.)



6 Direction of Piping Connection Kit

Place the piping connection kit parallel to the ground (the slope must be within +15º) as shown in the figure.



NOTE

The refrigerant system may be damaged if the slope of the piping connection kit exceeds +15º.

TCGB0119_rev2.indb 763 28/02/2018 17:11:42

10.5 Provision of pipes

Important considerations

1 The connectable indoor unit capacity ratio can be calculated as follows:

Connectable Indoor Unit Capacity Ratio = Total Indoor Unit Capacity / Total Outdoor Unit Capacity

2 The maximum number of connectable indoor units differs depending on the model, capacity, environment and installation place of connected indoor units.

3 For systems in which all indoor units are operated simultaneously, the total indoor unit capacity should be equal to or less than the outdoor unit capacity. Otherwise, it may cause a decrease of operating performance and operating limit in overload operation.

4 For the system under which all the indoor units are not supposed to operate simultaneously, the total indoor unit capacity is available up to 130% (standard) and 130% or 150% (high efficiency) against the outdoor unit capacity.

5 It is not encouraged to exceed the recommended number of connected units in cold regions (places where outdoor air temperature may fall below -10ºC). In case of connecting a capacity larger than 100%, it may occur that the discharge temperature of a part of the indoor units becomes extremely low, or that indoor units do not operate for a long period of time upon start up. It is highly recommended the installation of a central control to ensure that the total capacity of the indoor units working simultaneously doesn't exceed the outdoor unit capacity, especially if the system is intended to work at very high temperatures is cooling mode or very low temperatures in heating mode. When operating the outdoor unit in cold areas with temperatures of -10ºC, or under the high heating load conditions, the total indoor unit capacity should be less than 100% against the outdoor unit capacity and the total piping length should be less than 300m.

6 The air flow volume for indoor units of 0.8 and 1.0HP is set higher than that for indoor units of 1.5HP or more. Make sure to select appropriate indoor units when installing indoor units where cold draft may occur during heating operation. If installing indoor units in such places, refer to the recommended number of connectable indoor units.

7 Simultaneous operation of indoor units in the same operation mode is only possible up to a capacity ratio of 100%. If this combination ratio is exceeded, up to the respective maximum of 130% or 150% depending on the model, capacity loss may occur.

8 Since the load capacity per hour or the possibility to operate all indoor units simultaneously is unkown at the design stage, the total combined capacity of the indoor units should not exceed 100% of the outdoor unit capacity.

9 Limit to "Recommended maximum number of combined indoor units" when the piping length exceeds any of the conditions permitted in *"Pipe working conditions"* tables according to the models.

10 The refrigerant R410A is nonflammable and non-toxic. However, if leakage occurs and gas fills a room, it may cause suffocation. The maximum permissible concentration of R410A in air is 0.44 kg/m3, according to the refrigeration and air conditioning facility standard (EN378-1). Therefore, some effective measure must be taken to lower the R410A concentration in air below 0.44 kg/m3, in case of leakage. If the condition is not satisfied, it is required that the safety measure is added and the system is changed.

11 For connecting Wall Type (RPK-FSNH3M Series) with the Expansion Valve Kit, the number of connectable indoor unit is limited according to the total piping length between the expansion valve and the indoor unit. The total piping length must be less than the length indicated in the table. HITACHI will accept no responsibility for units that have been charged with non-specified refrigerant once.

12 Make sure to charge the correct quantity of additional refrigerant on site according to the length of the refrigerant liquid pipes, according to the number and model of indoor units, and according to the connection capacity ratio of indoor units. A charge too low or too high could cause damage to the compressor. It is of the utmost importance to adjust the appropriate amount of refrigerant when exceeding the recommended number of indoor units shown in brackets in column "Combination quantity" in chapter *"4.3 Indoor unit combinability"*.

NOTE

- *In the case that the piping length from the multi-kit at the first branch to the terminal indoor unit is over 40m, the size of the main piping should be increased by one size with reducers (field-supplied).*
- *Refer to "Pipe Branching Restriction" in this chapter for details.*
- *Where the refrigerant pipe length is greater than 100 m, the pipe diameter does not have to be increased after the first branch. Where the size of the multi-kit is greater than that of the first branch, adjust the size of the multi-kit to the first branch. Where the diameter of the pipe selected after the first branch is greater than the diameter of the pipe after it, use the same diameter as the inlet pipe.*

NOTE

- *Install the indoor unit and the multi-kit according to the instructions given in this manual.*
- *The connection kit is taken into account from the side of the indoor unit (as connection kit 1).*
- *The installation conditions for the refrigerant pipes are different depending on the number of indoor units connected.*
- *For 2 and 3 outdoor unit combination, the outdoor unit "A" should be connected to the piping connection kit 1. The details of piping connection kit shall be referred to the installation manual of itself.*
- *Check that the gas pipe and the liquid pipe are equivalent in terms of length and installation system.*
- *The piping length between outdoor units should be La ≤ Lb ≤ Lc ≤ 10m (If the piping length is incorrect, it may cause failure of outdoor unit due to flowing back the refrigerant).*
- *The total pipe length permitted must be less than 1000 m due to the maximum additional refrigerant charge limitation.*
- *Where the length of pipe L3 between each multi-kit and each indoor unit is considerably longer than on another indoor unit, the refrigerant will not flow correctly and performance is lower in comparison with other models (recommended pipe length: up to 15 m).*
- (*1): *Longer piping (up to 110m) is available for all models. Note that the approval from HITACHI Customer Service Department must be obtained beforehand in case that height difference is over 50m. Contact the HITACHI Customer Service Department in order to provide the relevant system characteristics for feasibility evaluation.*
- (*2): *When the total length of the refrigerant pipes exceeds 300 m, the maximum additional refrigerant charge is restricted.*

◆ Pipe branching restrictions (Installation with Main Piping Branch)

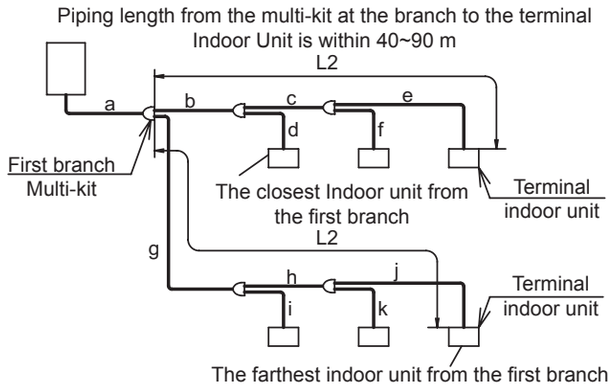
In the case that the piping length L2 from the multi-kit at the first branch to the farthest indoor unit is over 40m, follow the instructions below when performing the field-supplied piping work.

Example 1: Installation with Main Piping Branch

Piping length from the multi-kit at the first branch to the terminal Indoor Units is within 40-90 m

1 In the case that the piping length L2 is over 40m, the diameter size of gas and liquid lines “b and c” or “g and h” should be increased by one size with reducers (field-supplied).
   - If (a) is smaller than (b, c) after increasing the size, increase the size of (a) to the same size as (b, c).

2 The difference between the piping length from the first branch to the farthest indoor unit and the piping length from the first branch to the closest indoor unit must be within 40m.
   - (g+h+j)-(b+d) < 40m



NOTE

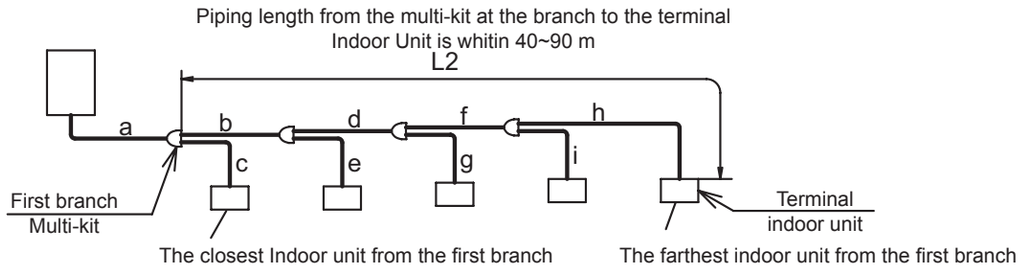
Main Piping Branch: Both of the pipes branched from multi-kit are connected to a further Multi-kit.

TCGB0119_rev2.indb 779 28/02/2018 17:11:56

Example 2: Installation without Main Piping Branch

Piping length from the multi-kit at the first branch to the terminal Indoor units is within 40-90 m

1 In the case that the piping length L2 is over 40m, the diameter size of gas and liquid lines “b, d and f” should be increased by one size with reducers (field-supplied).
   - If (a) is smaller than (b) after increasing the size, increase the size of (a) to the same size as (b).



◆ Heat pump system (with header branches)

Header branch can be used with line branch. Header branch can also be used after the second branch. Do not connect a line branch to a header branch. When using header branch, make sure that the piping length L2 from the multi-kit at the first branch to the farthest indoor unit is within 40m.

NOTE

When the maximum equivalent refrigerant pipe length (L1) from the outdoor unit/connection kit 1 to the indoor unit is greater than 100 m, the diameter of the gas/liquid pipe from the outdoor unit/connection kit 1 to the first branch must be increased using the reducer (field-supplied)

NOTE

Where the refrigerant pipe length is greater than 100 m, the pipe diameter does not have to be increased after the first branch. Where the size of the multi-kit is greater than that of the first branch, adjust the size of the multi-kit to the first branch. Where the diameter of the pipe selected after the first branch is greater than the diameter of the pipe after it, use the same diameter as the inlet pipe.

NOTE

- *For 2 to 4 outdoor unit combination, the outdoor unit "A" should be connected to the piping connection kit 1. The details of piping connection kit shall be referred to the installation manual of itself.*
- *The piping length between outdoor units should be La < Lb < Lc < 10m. (If the piping length is incorrect, it may cause failure of outdoor unit due to flowing back the refrigerant.)*
- *The condition of refrigerant piping installation is different depending on the connected indoor unit quantities.*
- *If the piping length (L3) between each multi-kit and indoor unit is considerably longer than other indoor unit, refrigerant may not flow well and also performance may be deteriorated compared to other models. (Recommended Piping Length: within 15m)*
- *The piping connection kit is counted from the indoor unit side (as Piping Connection Kit 1).*
- *Check the gas pipe and liquid pipe are equivalent in terms of the piping length and piping system.*
- *Use a multi-kit (system components) for the branch pipe of indoor unit.*
- *Install the indoor unit, multi-kit and CH-Box according to each "Installation & Maintenance Manual".*
- *In case that the combination of indoor unit capacity is 10HP for CH-AP280SSX, the performance may decrease approximate 5% in cooling and 10% in heating.*
- *The excess of the total capacity may cause insufficient performance and abnormal sound. Be sure to connect within the allowable total capacity.*
- *For the exclusive cooling operation, connect indoor units with low pressure gas pipe and liquid pipe (without CH-Box). The total capacity of the exclusive cooling operation should be smaller than 50% of the total indoor unit capacity.*
- *In case that a branch is located downstream of the CH-Box and also the connected indoor unit capacity is 1.5HP or less, use Ø15.88 for the gas pipe.*
- *(**): Longer piping (up to 110m) is available all models. Contact the HITACHI Customer Service Department if the height difference is over 50m.*
- *(*2): Recommended height difference between CH-Box and indoor unit is within 15m. If the height difference exceed this value, it may cause a decrease of operating performance.*

◆ Pipe branching restrictions (Installation with Main Piping Branch)

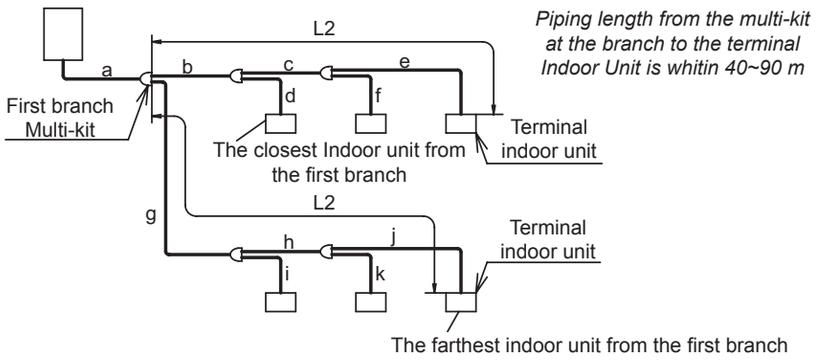
Unlimited number of Main Piping Branches as long as the following restrictions are respected.

In the case that the piping length L2 from the multi-kit at the first branch to the farthest indoor unit is over 40m, follow the instructions below when performing the field-supplied piping work.

Example 1: Installation with Main Piping Branch

Piping length from the multi-kit at the first branch to the terminal Indoor Units is within 40-90 m

1 In the case that the piping length L2 is over 40m, the diameter size of gas and liquid lines “b and c” or “g and h” should be increased by one size with reducers (field-supplied).
   - If (a) is smaller than (b, g) after increasing the size, increase the size of (a) to the same size as (b, g).
2 The difference between the piping length from the first branch to the farthest indoor unit and the piping length from the first branch to the closest indoor unit must be less 40m.
   - (g+h+j)-(b+d) < 40m



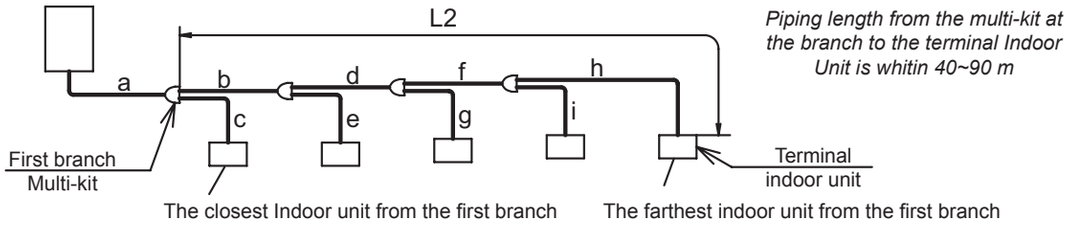
NOTE

Main Piping Branch: Both of the pipes branched from multi-kit are connected to a further Multi-kit.

Example 2: Installation without Main Piping Branch

Piping length from the multi-kit at the first branch to the terminal Indoor Units is within 40-90 m

1 In the case that the piping length L2 is over 40m, the diameter size of gas and liquid lines “b, d and f” should be increased by one size with reducers (field-supplied).
   - If (a) is smaller than (b) after increasing the size, increase the size of (a) to the same size as (b).



◆ Heat pump system (with header branches)

Header branch can be used with line branch. Header branch can also be used after the second branch. Do not connect a line branch to a header branch. When using header branch, make sure that the piping length L2 from the multi-kit at the first branch to the farthest indoor unit is less than 40m.

- *When the connected indoor unit capacity is 6.3 kW or less and the piping length exceeds 15m, use 9.52 mm (3/8 inch) for the liquid pipe.*

CAUTION

In case the piping connection is not used for the indoor unit side piping connection, it must be sealed using the closed flare nut originally attached. These flare nuts have been tightened by torque specifications shown below before shipping. Ensure that they are sealed completely.

• Tightening torque for flare nut before shipping

Item	Tightening Torque
Gas Pipe Flare Nut	75+7 Nm (55.3+5 ft/lbs)
Liquid Pipe Flare Nut	38+4 Nm (28.0+3 ft/lbs)

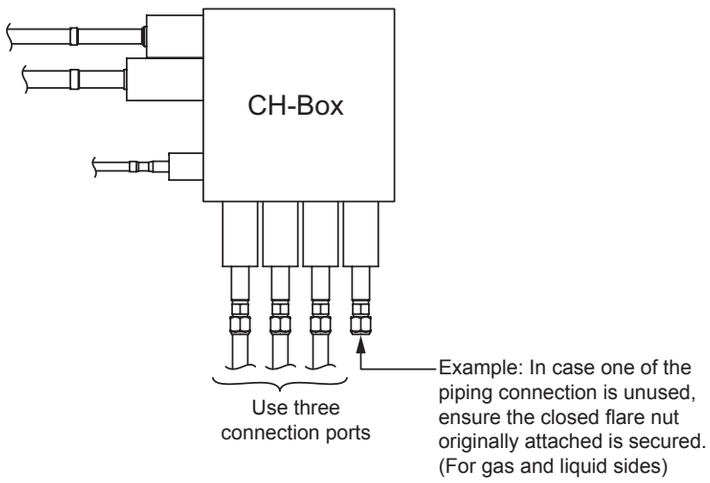
1 In case of 8 and 10HP type indoor unit connection:
   - Up to two 8 and 10HP type indoor units can be connected to the CH-Box within the “Maximum Total Capacity of All Connected Indoor Units”.
   - Make sure to increase the pipe connection size by using the appropriate accessory pipe.

2 In case of 8 and 10HP type indoor unit connection:
   - Only single unit per branch is allowed to be connected.

3 In case the number of indoor unit connection is less and the piping connections are left over:
   - Unused piping connections must be sealed using the closed flare nut originally attached.
   - It is unnecessary to attach closed-end piping.
   - Refrigerant leakage is caused by loosened flare nuts.
   - Ensure that they are sealed completely.
   - Use specified tightening torque according to the table “Tightening Torque for Flare Nut before shipping” above.
   - Any piping connections can be left over.

TCGB0119_rev2.indb 801 28/02/2018 17:12:13

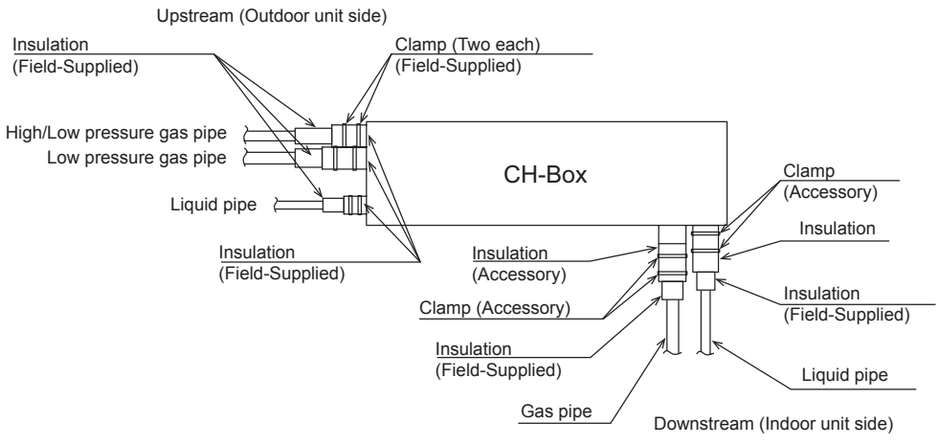
4 In case there is plan for additional indoor units in the future:
- Do not plan the piping size for additional indoor units. Ensure to select the piping again in the future.
- Additional indoor units can be connected only after the refrigerant is recovered.



Above figure illustrate the example of CH-AP04MSSX

10.7.8.2 Piping insulation

1 After the air-tight leakage test, perform insulation work as shown below.



2 Insulate gas and liquid pipe separately using the accessory insulation material. In the event that temperature and humidity levels inside the ceiling exceed 30 ºC / RH, relative humidity 80%, apply additional insulation materials (approximately 10mm (3/8 inch) thickness) to the surface of the accessory insulation material to avoid condensation.

3 Perform cold insulation work by insulating and taping the flare connection and reducer connection. Also insulate all the refrigerant pipes.

10.8 Refrigerant charge

⚠ CAUTION

- *Appropriate refrigerant*
  - *The refrigerant used in each unit is identified on the specification label and manuals of the unit. HITACHI shall not be held liable for any failure, trouble, malfunction or accident caused by units illegally charged with refrigerants other than the specified one.*
- *Consequences of charging non-specified refrigerant*
  - *It may cause mechanical failure, malfunction and other accidents. It may cause operational failure of protection and safety devices of air conditioners. It may also cause lubrication failure of the sliding part of the compressor due to deterioration of refrigerant oil.*
  - *In particular, hydrocarbon refrigerants (such as propane, R441A, R443A, GF-08, etc.) are not allowed, since these are combustible and may cause major accidents such as fire and explosion in case of improper handling.*
- *Once a non-specified refrigerant has been charged, no further servicing (including draining of refrigerant) shall be performed, even in case of malfunction. Improper handling of refrigerant may be a cause of fire and explosion, and servicing in such cases may be considered an illegal act.*
- *End clients and costumers shall be informed that servicing is not approved, and the installer who charged the non-specified refrigerant shall be asked to fix the unit.*
- *HITACHI will accept no responsibility for units that have been charged with non-specified refrigerant once.*

Charge the correct refrigerant quantity. If not, a compressor may be damaged due to an excess or insufficient refrigerant charge.

Refrigerant charge from check joint of gas stop valve may lead to compressor failure. Be sure to charge refrigerant from the check joint of liquid stop valve.

Insulate the liquid piping and gas piping completely to avoid decreasing of performance and dewing on the surface of the pipe. Insulate the flare nut and union of the piping connection.

Check to ensure that there is no gas leakage. If a large refrigerant leakage occurs, it will cause difficulty with breathing or harmful gases would occur if a fire was being used in the room.

Check the seal of the welds and flared connections. To do so, connect the measurement indicators on the check joints of the stop valves and on one vacuum pump or nitrogen gas bottle, using the flexible charge pipes of the indicators.

Check that the outdoor and indoor units are connected via the field-supplied refrigerant pipes.

If any leaks are found in the installation, repair and repeat the airtight test.

10.8.1 Installation airtight test

Check there are no refrigerant leaks in the welds and the flared connections of all the system. To do so, use a gas leak sensor or a soap and water solution.

1 Connect the manifold gauge to the check joints of the liquid line and the gas line stop valves using charging hoses with a vacuum pump or a nitrogen cylinder.
Perform the air-tight test.
Do not open the stop valves. Apply nitrogen gas pressure of 4.15MPa for FSXNSE / FSXNPE series.
For checking gas leakage, use the leak detector or forming agent. If there is any leakage, fix the leaking part.

2 For checking gas leakage, do not use a forming agent which generates ammonia. Additionally, do NOT use a household detergent as forming agent whose components are not clear. The recommended forming agent for checking gas leakage is shown below.

⚠ DANGER

Only use nitrogen gas when testing for leaks. Never use oxygen, acetylene or fluorocarbon gas; these could result in an intoxication or explosion. Apply a maximum pressure of 4.15 MPa of nitrogen gas to the installation.

TCGB0119_rev2.indb 804 28/02/2018 17:12:15

10.8.2 Installation vacuum

Connect a manifold gauge, vacuum gauge and vacuum pump to the check joints (Gas Stop valve and Liquid Stop valve).

◆ **Basic Method**

1 Vacuum until the pressure reaches 500 microns (0.5 mmHg) or Lower for two hours.
2 After vacuum pumping work, stop the vacuum pumping and leave the gauge for one hour.
3 Check to ensure that the pressure in the vacuum gauge does not increase.
4 Tighten the caps of check joint according to the specified torque after the vacuum drying work.
5 If the pressure inside the gauge does not reach 500 microns, it is considered that there is gas leakage.
6 Check for any gas leakage once again.
7 If no leakage exists, it might be moisture remains inside the pipes.

NOTE

If the penetration of moisture is suspected, perform "Triple Evacuation Method" that is described in the next paragraph.

◆ **Triple Evacuation Method**

According to the following [Step 1] [Step 2] [Step 3] in order, conduct vacuum drying work.

[Step 1]

1 Vacuum until the pressure reaches 2000 microns (2.0 mmHg).
2 Pressurize with nitrogen up to 0.3 MPaG (50 PSIG) for 15 minutes.
3 Release pressure to atmosphere level as less than 0.03 MPaG (5 PSIG).

[Step 2]

1 Vacuum until the pressure reaches 1000 microns (1.0 mmHg).
2 Pressurize with nitrogen up to 0.3 MPaG (50 PSIG) for 15 minutes.
3 Release pressure to atmosphere level as less than 0.03 MPaG (5 PSIG).

[Step 3]

1 Vacuum until the pressure reaches 500 microns (0.5 mmHg).
2 Stop vacuum pump.
3 Check that the vacuum 500 microns (0.5 mmHG) can maintain for one hour.

NOTE

- *If tool or measuring instruments come into contact with the refrigerant, use the tools or the measuring instruments exclusively for R410A.*
- *Do not perform vacuuming pumping work with valves of the outdoor units open. Otherwise, the refrigerant charged before shipment may leak and it may result in failure. If moisture remains inside the pipes, the compressor may be damaged.*

10.8.3 Charging work

1 The additional refrigerant charge is required according to the total piping length.
2 After vacuum pumping work, check that the gas stop valve and liquid stop valve are fully closed. Charge the additional refrigerant from the check joint of liquid stop valve (acceptable error must be within 0.5 kg).
3 After the refrigerant has been charged, fully open the liquid stop valve and the gas stop valve.

NOTE

The gas staying at O-ring or screw part may make sound when removing the cap of the spindle.
However, it is not gas leakage.

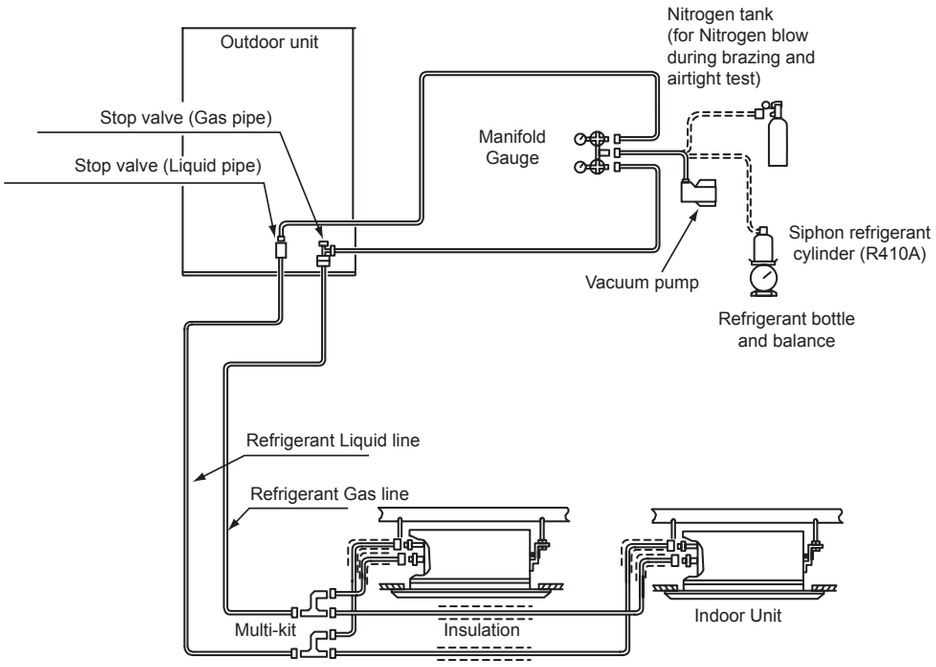
4 If it is impossible to charge the specified quantity of refrigerant, follow the procedure below.
   a. Fully open the stop valve for the gas line.
   b. Operate the compressor in the cooling mode and charge the additional refrigerant from the check joint of the liquid stop valve (acceptable error must be within 0.5 kg). At this time, keep the liquid stop valve slightly opened
   c. After the refrigerant is charged, fully open the liquid stop valve and the gas stop valve.

TCGB0119_rev2.indb 805 28/02/2018 17:12:15

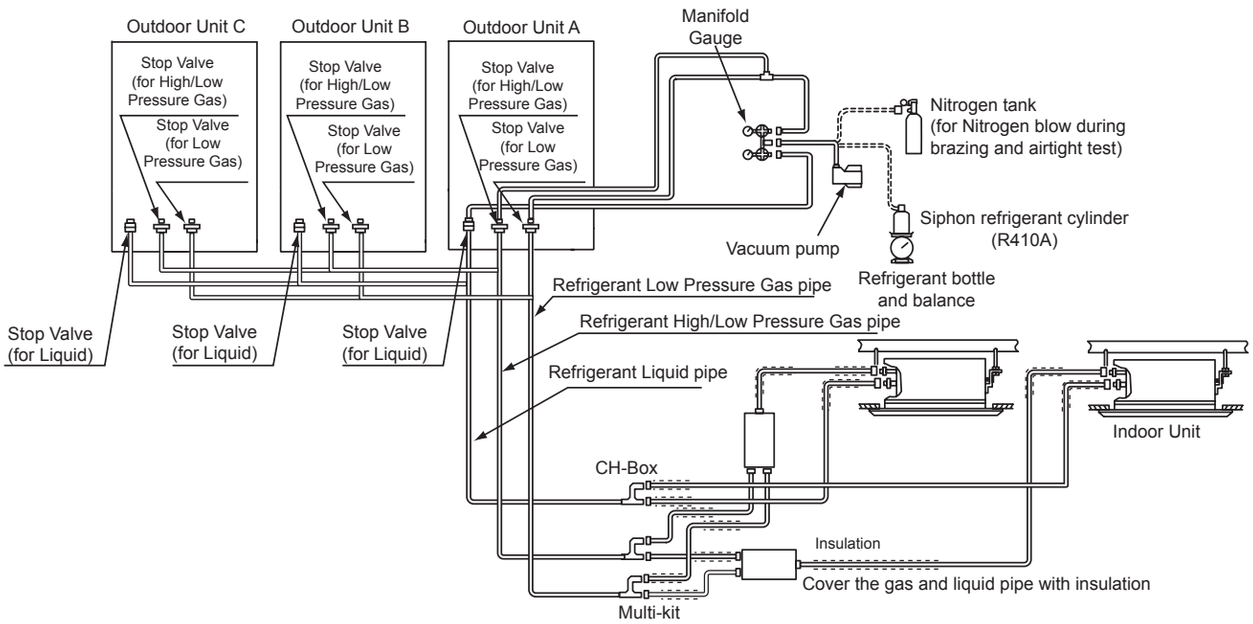
d. Calculate securely the additional refrigerant quantity for charging. If the quantity of additional refrigerant is not correct, it may cause compressor failure. The additional refrigerant must be charged in a liquid condition.

e. Refrigerant charge from check joint of gas stop valve may lead to compressor failure. Be sure to charge refrigerant from the check joint of liquid stop valve.

◆ FSXN(S/P)E - Heat Pump



◆ FSXN(S/P)E - Heat recovery



NOTE

- *Only tools and indicators specifically for use with R410A refrigerant gas should be used.*
- *Do not open the stop valves on the outdoor unit.*

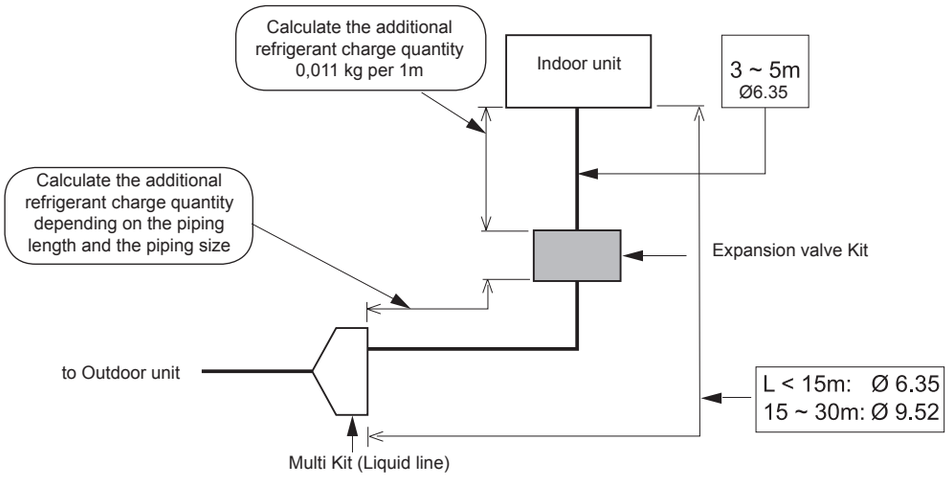
TCGB0119_rev2.indb 809 28/02/2018 17:12:17

Additional Refrigerant Calculation for Wall Type(RPK-FSNH3M Series)

The additional refrigerant calculation for Wall Type (RPK-FNSH3M Series) with the Expansion valve kit is as follows. Refer to the item “Calculating method of additional refrigerant charge W1”.

1 Firstly calculate the additional refrigerant amount for the liquid pipe between multi-kit and the Expansion valve kit according to the piping length and diameter.
2 Then, calculate the additional refrigerant amount for the liquid pipe between indoor unit and the Expansion valve kit (Pipe diameter: 6.35. Refrigerant amount for 1m pipe: 0.011kg/m).



NOTE

Check the installation limits and restrictions.

10.8.7 Refrigerant charge

Once the installation has been emptied, check that the stop valves are fully closed. To do so, remove the caps and check that they are closed with the corresponding torque.

Charge the total additional refrigerant as calculated.

If it is not possible to charge the total quantity of additional refrigerant, proceed as follows:

1 Fully open the gas stop valve (in the case of heat recovery outdoor units, open the high and low pressure gas valves).
2 Start the system running in cooling mode and open the liquid outlet valve of the measurement indicators connected to the check joints of the stop valves.
3 Slightly open the liquid stop valve (tolerance of quantity of total additional refrigerant: 0.5 kg).
4 When all the refrigerant has been charged, fully open the liquid stop valve.

CAUTION

- *Only charge the quantity of additional refrigerant as calculated. Too low or too high a charge could cause damage to the compressor.*
- *The refrigerant should be charged through the liquid stop valve. If the refrigerant is charged through the gas stop valves, the compressor will be damaged.*

Fill in the F-Gas Label.

10.9 Precautions in the event of refrigerant leaks

DANGER

- ***Fitters and the designers of the installations must strictly observe local and national legislation, and local codes regarding safety requirements in the event of refrigerant leaks.***
- ***The following standards may be applicable, if local regulations are not available. International Organization for Standardization, ISO5149 or European Standard, EN378***

10.9.1 Maximum permitted concentration of hydrofluorocarbon (HFC)

The R410A refrigerant gas, used in the equipment, is fireproof and non-toxic.

DANGER

In the event of a leak, the gas will spread around the room, displacing the air, and could therefore result in asphyxia.

The maximum permissible concentration of HFC R410A gas in the air is 0.44 kg/m^3, according to Standard EN378-1. Consequently, effective measures must be adopted to maintain the concentration of R410A gas in the air below 0.44kg/m^3 in case of leakage.

NOTE

Before the indoor unit installation, confirm that the room can keep the lower gas concentration than the limit value in order to take the emergency countermeasures even if the gas leakage is occurred.

10.9.2 Calculation of the refrigerant leakage

1 Calculate the total quantity of refrigerant *R* (kg) charged in the system. To do so, connect all the indoor units of the rooms in which you wish to have air conditioning.
2 Calculate the volume *V* (m^3) of each room.
3 Calculate the refrigerant concentration *C* (kg/m^3) of the room in accordance with the following formula:

$$R / V = C$$

R: total quantity of refrigerant charged (kg).
V: volume of the room (m^3).
C: concentration of refrigerant (≤ 0.44 kg/m^3 for R410A gas).

10.9.3 Countermeasures in the event of refrigerant leaks

The room should have the following characteristics in case of a leak of refrigerant:

1 Opening without shutter to permit the circulation of fresh air in the room.
2 Opening without door measuring 0.15%, or greater, of the floor surface.
3 A fan with a capacity of at least 0.4 m^3/minute per Japanese tonne of refrigeration (= volume displaced by the compressor / 5.7 m^3/h) or greater, connected to a gas sensor in the air conditioning system which uses the refrigerant.

11.1 General information

CAUTION

- *Before any electrical wiring work or regular inspections, switch off the mains power supply of the indoor and outdoor units. Wait three minutes before starting installation or maintenance work.*
- *Make sure that the indoor and outdoor fans have come to a complete standstill before starting work on the electrical wiring or regular inspections.*
- *Protect cables, drain hose, electric parts, etc. from rodents and insects; otherwise these might damage unprotected components and, in the worst case, cause a fire.*
- *Do not allow cables to come into contact with the refrigerant pipes, metal edges, printed circuit boards (PCB) or the electric parts inside the unit; the cables may be damaged and, in the worst case, cause a fire.*
- *Firmly secure the cables inside the indoor unit with plastic flanges.*
- *Connecting the operating line cables incorrectly may lead to faults in the PCB.*
- *Before starting work on the installation of the outdoor unit, place the DSW7 in the correct position according to the expected supply voltage: "11.3 Setting of the DSW on PCB1".*

DANGER

- ***Use an earth leakage breaker with medium sensitivity, and an activation speed of 0.1 sec or less. If this is not fitted, there is a risk of electric shock and/or fire.***
- ***Install an earth leakage breaker, fuse and circuit breaker for each outdoor unit power line. Not fitting it may cause an electric shock or fire.***

TCGB0119_rev2.indb 816 28/02/2018 17:12:20

11.2 General verifications

1 Make sure the electric components supplied by the installer (main power switches, circuit breakers, wires, connectors and connection terminals) have been selected correctly in line with the electrical data given.

   a. The electricity supply to the unit should be via an exclusive power control switch and protective circuit breaker, certified and installed in accordance with local or national safety regulations.

   b. The electricity supply for the outdoor and indoor units should be separate. Connect the voltage supply wiring for each group of indoor units to the same outdoor unit (maximum capacity for each group of indoor units: 26 HP).

   c. For heat recovery systems, the CH-Box and the indoor unit of the same refrigerant cycle can be supplied from the same mains power supply.

2 Check that the supply voltage is between 90 and 110% of the rated voltage. Where the voltage capacity is too low, it will not be possible to start the system due to the drop in voltage.

3 Sometimes, the refrigeration/heating system is not able to operate correctly in the following cases:

   - When the system is supplied from the same supply line as other major consumers (heavy machinery, power inverter systems, cranes, welding machinery, etc).
   - When the supply cables of the major consumers and the refrigeration/heating system are very close together.

   In these cases, induction in the wiring to the refrigeration/heating system may arise due to a rapid change in the electricity consumption of the above consumers and their start-up. Therefore before starting installation work, check the regulations and standards concerning adequate protection of the power supply line.

NOTE

For further information, please refer to the applicable legislation in the country in which the unit is to be fitted.

4 During the preliminary preparation work of the electricity supply line for the unit, the provisions in local and national legislation must never be violated.

5 Check that the earth cable is correctly connected.

DANGER

- ***Never connect the earth cable to the refrigerant pipes. The gas in the pipes could cause a fire.***
- ***Do not connect the earth cable to the lighting arrest system. The electrical potential of earth would increase abnormally.***

11.4 Outdoor and indoor units electrical settings

General instructions to bear in mind when connecting the shared wiring between the outdoor and indoor units:

1 Local or national regulations must be followed at all times during the preliminary work to prepare the communication line between units.

NOTE

For further information, please refer to the applicable legislation in the country in which the unit is to be fitted.

2 The units are installed grouped together for each planned refrigerant cycle. As a result, the refrigerant pipes and the control cables are connected grouped to the units belonging to the same refrigerant cycle.

3 Use a shielded twisted pair cable or shielded pair cable with a cross-section of over 0.75 mm^2 (equivalent to KPEV-S) for communications between the outdoor and the indoor unit and between the indoor units.

4 Always use a 2-core cable for the operating line. Never use a cable with more than three cores.

5 Use shielded cable for intermediate wiring on lengths of less than 300 m to protect the units from electrical noise and electromagnetic interference. The size of the cable must be in line with national and local regulations.

6 Make a hole close the power cable connection opening when connecting several outdoor units from one power line.

7 Make sure the electric components supplied by the installer (main power switches, circuit breakers, wires, connectors and connection terminals) have been selected correctly in line with the electrical data given in this manual.

NOTE

Secure the rubber bushes with adhesive when the outdoor unit ducts are not used.

11.4.1 Connection of outdoor units

Remove cover to the refrigerant pipes.

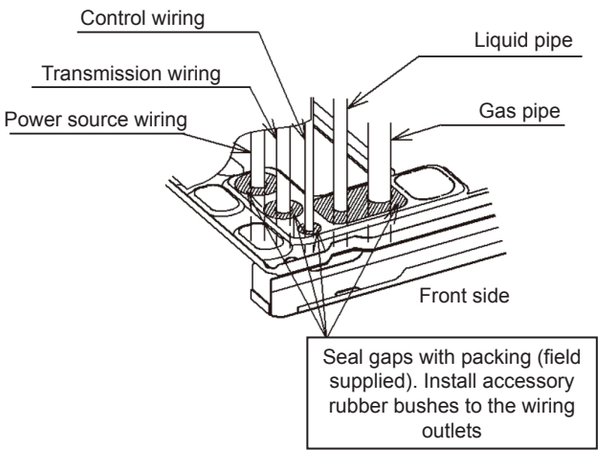
The power and transmission cables should be inserted in the unit through the pre-drilled holes and lower rubber bushing provided, using a different protective duct for each one.

NOTE

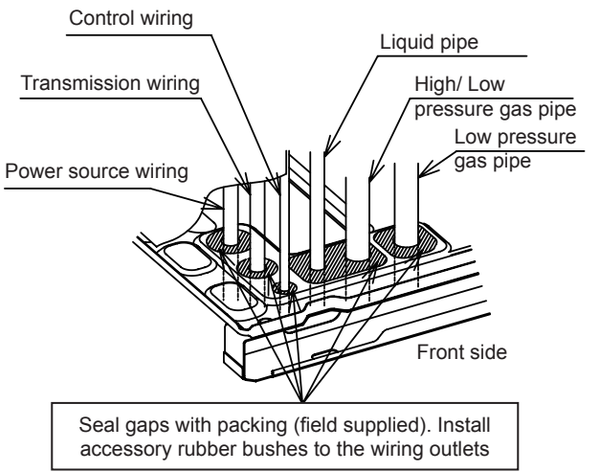
Do not insert the supply and communication cables together through the same protective duct. Keep a minimum distance between them of 50 mm.

Fit the cover on the pipes and completely seal access of the pipes to the unit, to prevent the entrance of water, rodents and dirt.

For heat pumps system (2 pipes)



For heat recovery system (3 pipes)

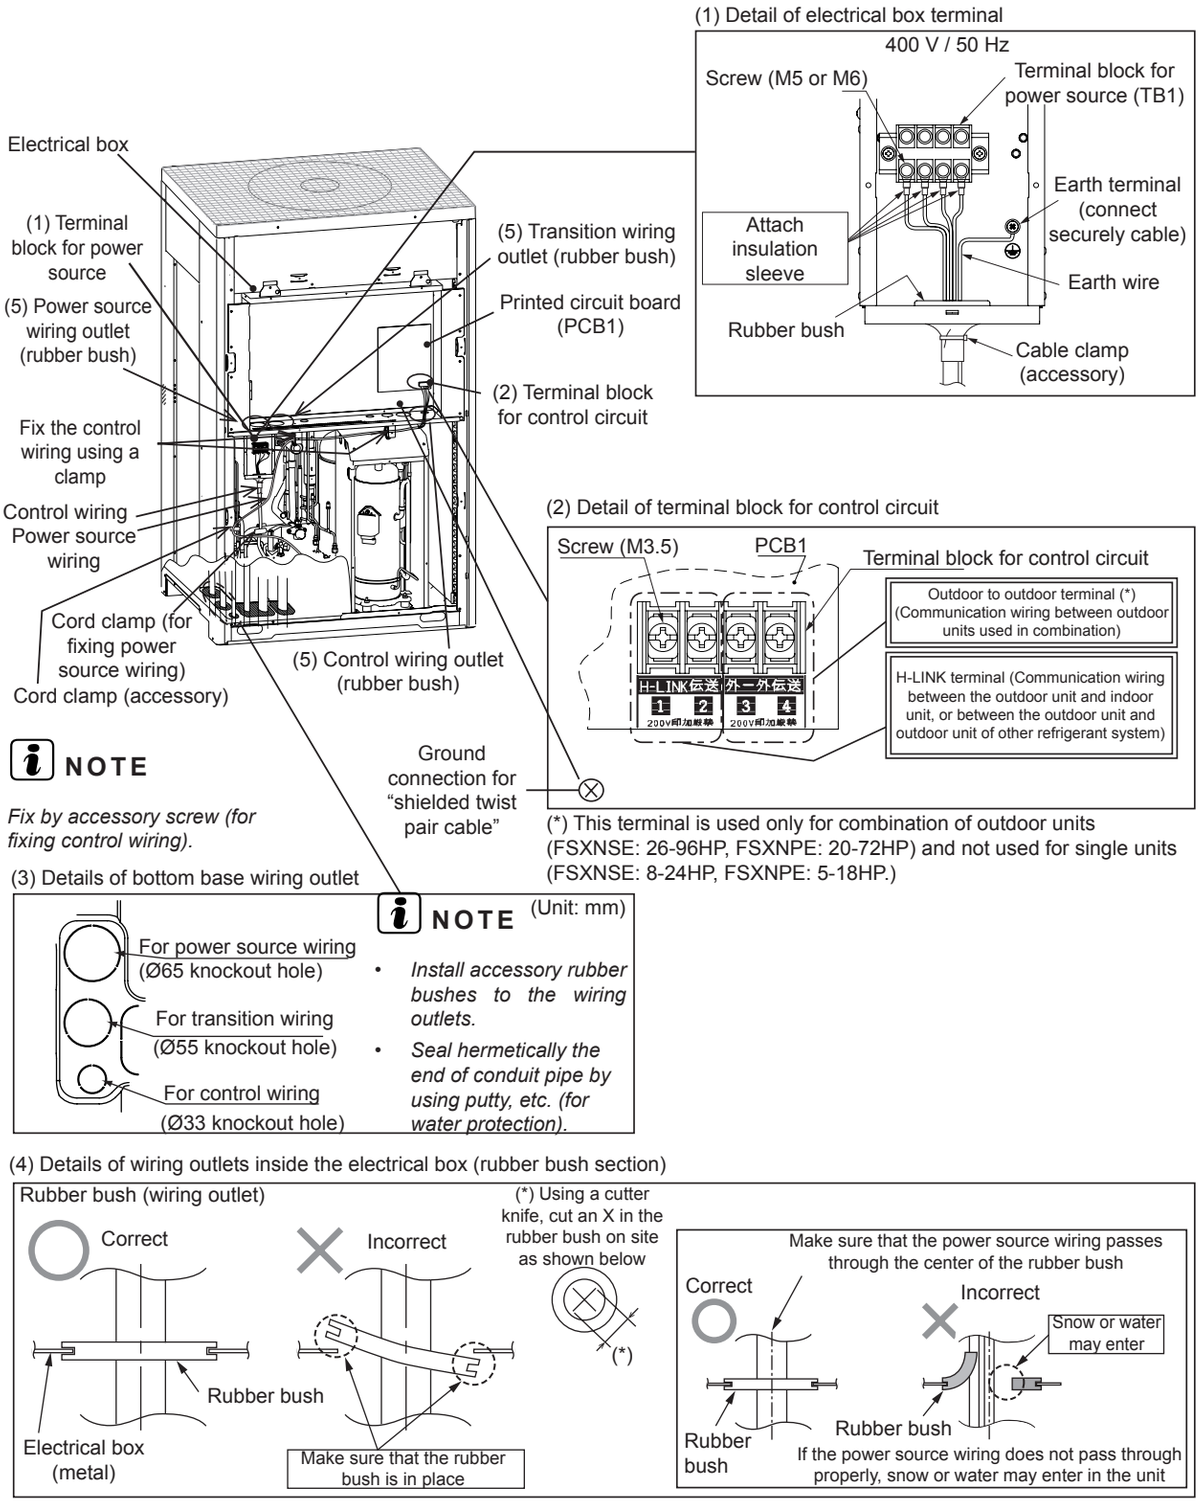


Do not allow the cables to touch the refrigerant pipes, sharp metal edges or electric parts from inside the unit.

NOTE

- *Fasten the power cables with the flanges provided inside the unit.*
- *Attach unused rubber bushings with adhesive.*
- *Make a drainage hole in the lowest part of the protective duct.*

TCGB0119_rev2.indb 822 28/02/2018 17:12:25



Connect the three-phase power cables on terminals L1, L2, L3 and N of the TB1 terminal board and connect the earth wire to the screw-in terminal. Use insulated terminals or heat-shrink covers.

Connect the communication cables on the terminals of the TB2 -C- of the PCB1:

- From the indoor units to the outdoor unit: terminals 1 and 2.
- From the outdoor unit to the next outdoor unit in the same refrigerant cycle: terminals 3 and 4:

NOTE

Completely seal the entrance to the duct using sealant, etc. to prevent water from entering.

Tighten the connection terminals as shown in the following table:

Size	Tightening torque (Nm)
M4	(1.0–1.3)
M5	(2.0–2.5)
M6	(4.0–5.0)
M8	(9.0–11.0)
M10	(18.0–23.0)

11.4.2 Connection of indoor units

Connect each outdoor unit to a power supply line. Install an earth leakage breaker, fuse and circuit breaker for each outdoor unit power line.

Connect each group of indoor units corresponding to an outdoor unit to a voltage supply line (maximum capacity for each group of indoor units: 26 HP). Install an earth leakage breaker, fuse and circuit breaker for each group of indoor units.

Connect the communication cable between the indoor units, the CH-Boxes and the outdoor units.

Connect the communication cable on the corresponding units to the same refrigerant cycle. (Where the refrigerant pipe of the indoor unit is connected to the outdoor unit, connect the communication cable to the same indoor unit).

NOTE

Connecting the refrigerant pipe and the communication cable to units in different refrigerant cycles may lead to operating problems.

Use shielded twisted pair cable or shielded pair cable. Do not use cable with three or more conductors.

Use the same type of cables for the H-LINK system of units in each refrigerant cycle.

Ensure a minimum distance of 50 mm between the power cables and the communication cables and 1500 mm between these and the power cables of other electrical devices. Where this is not possible, install power cables in a metal duct separate from the others.

Connect the communication cables to TB2 terminals 1 and 2 on outdoor unit A (main unit):

- Between the outdoor unit and the indoor unit.
- Between the outdoor unit and the CH-Box.
- Between the outdoor unit and the indoor unit on other refrigerant cycles.

CAUTION

Do not connect power cables to communication terminals (TB2). This could damage the circuit board.

For heat recovery systems, connect the communication cable on the indoor unit (used exclusively for refrigeration) to TB2 terminals 1 and 2 on the CH-Box.

Connect the earthing cable for the outdoor units, the indoor units and the CH-Boxes. Earthing connections below a resistance of 100 Ω (max.) must be made by skilled personnel.

NOTE

- *Check the setting of the DSWs on the main and secondary outdoor units for the combination of (FSXNSE: 26-96HP / FSXNPE:20-72HP) outdoor units.*
- *An alarm is triggered if the communication cables between the outdoor units are connected to terminals 1 and 2 for H-LINK II.*
- *Where an alarm is indicated on the display of the main outdoor unit, follow the instructions given to make the necessary checks.*
- *Make the function settings from the main outdoor unit.*
- *Maximum number of refrigeration groups with one remote control: 64.*
- *Maximum number of indoor units connected: 160.*

Index

12.1 Optional functions available in the outdoor units..... 836

12.1 Optional functions available in the outdoor units

External input function	
Optional function	**Explanation**
Fixing Operation Mode (Heating/Cooling)	This function fixes the operation mode, heating or cooling. If indoor unit is set on Heating (Cooling) mode when Cooling (Heating) mode is fixed, the indoor unit will be thermo-OFF.
Demand stoppage	When this function is enabled, the compressor is stopped and the indoor units are put under thermo-OFF condition.
Outdoor unit fan motor stop/ start (snow sensor)	This function starts all the outdoor fan motors and are operated at the full speed if the outdoor temperature is below 10 °C (When the outdoor temperature is higher than 10 °C, the fan motor will not be operated) during compressor stoppage in order to prevents the outdoor units from a condition covered with snow.
Forced stoppage	This function produces an emergency stoppage. The compressor and indoor fans do not operate.
Demand Current Control	This function regulates Outdoor running current 40%, 60%, 70%, 80%, 100%, if demanded current is above set, the indoor unit capacity is reduced still thermo-OFF if needs.
Forced noise reduction	This function reduces the compressor and fan rotation frequency and, as a result, the sound level and capacity. (4 sound pressure level cases can be selected)

External output function	
Optional function	**Explanation**
Operation signal	The operation signal is sent to output terminals when the indoor units (or a single indoor unit) are operating. This function can be used for the circulation or humidification operation.
Alarm signal	This function is used to receive the alarm signal. The alarm signal will be sent to output terminals when the indoor units (or a single indoor unit) are operating and an alarm occurs in the system.
Compressor ON signal	This function is used to receive the compressor operation signal.
Defrosting signal	This function is used to receive the defrosting signal.

Optional functions (by 7–segment display)	
Optional function	**Explanation**
Indoor unit fan control during the thermo-OFF in heating mode	Normally, the fan speed is changed to “LOW” at heating thermo-OFF. However, the indoor fan motor is operated at “LOW” and stopped repeatedly by setting this function.
Night-shift (low noise)	The night shift operation shall be applied in case the cooling capacity has the allowed range to decrease the capacity and the low noise level operation is required especially at night.
Cancellation of the outdoor ambient temperature limit.	The heating operation is continued under a high outdoor temperature or the cooling operation is continued under a low temperature.
Defrost for cold area (change in the defrost condition)	This function changes the defrosting operation conditions. It is particularly useful in cold areas.
SLo (fan speed) Defrost setting	When this function is enabled, the indoor fan speed in defrost mode switches to slow instead of stopping the fan.
Cancellation of the hot start	
Priority capacity mode	By setting this function, the target frequency and current limit of the compressor are set higher.
Minimum evaporating temperature setting for cooling	
Target value of the compressor frequency for heating	
Target value of the Indoor unit expansion valve control for cooling	
Target value of the Indoor unit expansion valve control for heating	
Indoor expansion valve opening change for stoppage indoor unit in heating mode	
Indoor expansion valve opening change for thermo-OFF indoor unit in heating mode	
Indoor expansion valve initial opening of thermo-ON indoor unit in heating mode	
Fine adjustment of indoor expansion valve initial opening in cooling mode (initial opening)	
Fine adjustment of indoor expansion valve initial opening in heating mode (initial opening)	
Low noise setting (in the case of low noise setting, the working range in cooling/heating will be restricted)	This setting reduce the compressor frequency and the outdoor fan motor rotation frequency.
Demand function setting	Demand control setting is adapting the self-demand function, which causes the power consumption to drop drastically for the purpose of saving energy.
Wave function setting	This function sets the outdoor flow. If the flow demanded is above the flow set, the capacity of the indoor unit is reduced and the thermostat may even be disabled if necessary. Control of the operation flow is not a set value and may vary within a range.
Cold draft protection	The discharge air temperature of the indoor unit is also low, the outdoor unit is switching operation mode to prevent this low discharge air temperature.
Fan rotation adjustment (to prevent humming noises in multiple installation)	If the outdoor unit fans makes a whining sound in case of the multiple installation, set this operation in the required outdoor units.
Intermittent operations of outdoor fan motor	When the outdoor temperature reaches the setting temperature, all the outdoor fan motors start intermitted operation. When the outdoor temperature is at least 5ºC higher than the setting temperature, the outdoor fan motors stop operating.
Indoor expansion valve control target value for cooling (Only for RCI-FSN4 series)

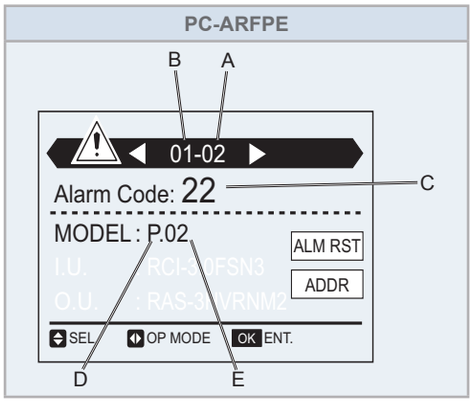
13.1 On-screen displays during abnormal operation



Abnormal operation can be produced due to the following reasons:

◆ Malfunction

If the RUN LED flickers for 2 seconds, there is a failure in the transmission between the Indoor Unit and the Remote Control Switch.

Possible causes are:

- Broken remote cable
- Contact failure in the remote control cable
- Defective IC or defective microcomputer

In any case, ask your retailer for service.

If the RUN LED flickers 5 times (5 seconds) with the unit number and the alarm code displayed, make a note of the alarm code (refer to the table below) and ask your retailer for service.

The RUN (red) indicator flashes

The ALARM indicator appears on the liquid crystal display.

The screen also displays the following items:

- A: indoor unit address (Abnormal Indoor Unit Number).
- B: Refrigerant cycle number (Abnormal Ref. Cycle Number).
- C: Alarm code.
- D: Model code. Abnormal operation can be produced due to the following reasons:

Model code	
Indication (P)	Model
H	Heat pump
P	Inverter
F	Multi (SET-FREE)
E	Other
L	KPI

- E: If there are various indoor units connected, the above mentioned information is shown for each one of them.

◆ Power supply failure

All displays disappear.

If the unit stops due to a power shortage, it will not start again, even though the power comes back on. Carry out the start-up operations again.

If the power failure lasts less than 2 seconds, the unit will start again automatically.

◆ Electrical noise

The displays can disappear from the screen and the unit can stop. This is because the microcomputer has been activated to protect the unit from electrical noise.
